Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

° Includes crop damage
C Crop damage
N No report received by printing deadline

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
\# Freezing drizzle and freezing rain, commonly known as glaze.
ø For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, ESSA, monthly publication STORM DATA.

† Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5,000,000
7 $5,000,000 to $50,000,000
8 $50,000,000 to $500,000,000
9 $500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

JULY 1969

Elmer R. Nelson, Office of Hydrology

One of the most damaging floods during July occurred in northern Ohio. The hardest hit communities were Wooster, Ashland, Millersburg, Loudonville, and Killbuck, Ohio, in the Ohio Basin and Norwalk and Vermillion in the Great Lakes Drainage. The total flood damages were estimated between $70 million and $140 million. Of the 46 fatalities reported, 30 were due to floods.

Severe flooding occurred in Iowa. Record flooding occurred on the Iowa and Wapsipinicon Rivers and on Black Hawk Creek. Record high stages were also reported on the Pecatonica River in Wisconsin and Illinois.

ST. LAWRENCE DRAINAGE

Lake Erie.--Severe flooding occurred along the Vermillion River in Huron and Lorain Counties, Ohio, from the severe thunderstorm during the evening of July 4 and morning of July 5. The hardest hit community was Vermillion, Ohio. Norwalk, Ohio, on the West Fork of the Huron River also suffered heavy damage. The storm came on shore about the time great crowds of people were gathering in parks for special 4th of July entertainment and fireworks displays. Over 10 inches of rain fell in some inland places from the lake and near the headwaters of the major streams. A Civil Defense official in Lorain County advised that they received information on the impending severe weather in time to completely evacuate Cascade Park in the City of Elyria, Ohio, where approximately 2,000 persons had gathered for entertainment. This same storm caused severe floods in adjoining area in the Ohio Basin.

ATLANTIC SLOPE DRAINAGE

Some towns in the lower Merrimack Basin (Lawrence, Methuen, and North Andover, Mass.) experienced flooding of streets and basements on the 12th, with substantial damage to some downtown businesses. It was due primarily to culvert and storm sewer overflows. Major flash flooding occurred on small streams in eastern and central Vermont on the 29th. Major damage resulted from the overflows and landslides along the rain-drenched hillsides. Minor flooding occurred in Connecticut, Massachusetts, New Hampshire, and Rhode Island. A good portion of this flooding was due to the inability of culverts and sewers to carry the heavy surface flow that occurred. Rainfall amounts near 6 inches occurred in less than 24 hours on the 28-29th in the Springfield, Vt., area. The total damage in Vermont was estimated at $700,000. Six families were evacuated from a small valley. Heavy road damage occurred in Windsor, Springfield, Weatherfield, and Brattleboro, Vt., areas. The last three of these communities were declared disaster areas by the Governor of Vermont.

Flash flooding developed in Atlantic City, N. J., on the 23d due to excessive rainfall. Streets, basements, and roads were flooded in a large area from Atlantic City to Northfield and Pleasantville, N. J. Heavy rains on the 27-29th caused extensive flash flooding in the Philadelphia-Camden area, Wilmington, Del., area, and along many streams and creeks throughout eastern Pennsylvania, northern and central New Jersey, and in Sullivan County, N. Y. The heaviest damage occurred in Monroe County in northeastern Pennsylvania and in Sullivan County, N. Y. In northeastern Pennsylvania, heavy damages occurred to property along the Swiftwater, Pocono, and Brodhead Creeks and their small tributaries. Over 200 people were evacuated from along the Brodhead Creek and from Canadenis to Analomik. Three drownings were reported, one in the Poconos, one in Philadelphia, and one in the Wilmington, Del, area. In Sullivan County, N. Y., the total damages ran as high as $3 to $4 million. Damage to underground sewer systems is still undetermined. More than 250 people were evacuated from the town of Rockland and about 200 to 250 people were evacuated by boat from Livingston Manor. The heavy rainfall (4 to 8 inches) that fell in a few hours caused the Willowemoc, Little Beaverkill, the Big Beaver Kill Creek, and many small tributary Creeks to rise to abnormally high stages, resulting in extensive damages.

Heavy thunderstorms during the evening of the 22d caused flash flooding in the Washington, D. C., metropolitan area. About 300 square miles of the 1,200 square mile metropolitan area received 4 to 7 inches of rain. The heaviest precipitation recorded for the 12-hour storm was 7.52 inches at Vienna, Va. At the Washington National Airport, 4.38 inches of rain was measured during the period. The heaviest flooding occurred on Four Mile Run in the Arlandria section of Alexandria, Va. The damage to the residential apartments and commercial section was heavy. The Corps of Engineers estimated the damage at $4.3 million.

Heavy rains during the night of the 22-23d caused flash flooding in Henrico, Chesterfield, East Goochland, and Hanover Counties in Virginia and in the City of Richmond. The rainfall over a 12-hour period ranged from 3.25 to over 6 inches. The hardest hit section was along Gillies Creek in Fulton Bottom, City of Richmond, where 40 families were evacuated.

Flash flooding occurred in the Pee Dee River Basin at Cheraw, S. C., on the 29th. The rainfall totaled 4.97 inches in a little more than a 24-hour period. Damage was due to water rising and entering first floor of 8 to 10 homes. Damage was estimated at $3,000. The Lumber River at Lumberton, N. C., continued in flood from June 9 to July 17.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--Little or no damage resulted from the minor flooding in the upper Iowa near Dorchester, Iowa, and on the Wisconsin River at Portage, Wis., during the latter part of June and the first part of July.

The flooding on the Turkey River at Garber, Iowa, on June 28 to July 1 was due to heavy showers on June 25-29.

Major flooding occurred on the Maquoketa and Wapsipinocon Rivers in Iowa and the Pecatonica River in Wisconsin and Illinois during July. Record high stages occurred on the Wapsipinicon River at DeWitt, Iowa, and on the Pecatonica River at Martintown, Wis., and Freeport, Ill. Flooding was due to heavy showers during the last week in June and 1- to 2-inch rains during the first half of July. At Moline, Ill., an alltime monthly record of 12.39 inches was recorded.

Record flooding occurred on Black Hawk Creek at Hudson, Iowa, and on the Iowa River at Steamboat Rock, Marshalltown, and Wapello, Iowa, during July. The U. S. Geological Survey reported that the runoff was the highest for any July in 70 years on the Des Moines, Skunk, and Iowa-Cedar Rivers. The runoff at Cedar Rapids on the Cedar River was the highest for any month of record. This severe flooding in central Iowa was due to heavy rainfall superimposed on the high flow from earlier rains.

The Mississippi River at St. Louis, Mo., reached a

crest of 35.9 ft. on the 14th. This was 5.9 ft. above flood stage and the highest stage reached at St. Louis in the past 18 years. A stage of 41.3 ft. was reached in 1951. Most of the flooding in the St. Louis area was restricted to low-lying farmland. Considerable flooding occurred along the Mississippi River above and below St. Louis but none below the mouth of the Ohio River.

Missouri Basin.--Severe thunderstorms in southeastern Montana on the afternoon of the 18th caused Blue Creek, West Buckeye, Beauvis, and Soap Creek to exceed bankfull stage for a brief period. A diversion dam was washed out on Soap Creek with an estimated loss of $15,000. Along West Buckeye Creek, some cattle were drowned and some damage occurred to buildings. Two inches of rain fell in 20 minutes and 4 inches in 45 minutes at Lodge Grass, Mont. Some bridges and irrigation ditches were washed out.

Heavy rainfall on the 18th caused local flooding in the Hazen-Beulah, N. Dak., area. Nearly 200 homes in the Hazen area were flooded, 25 of them seriously. Most of the flooding was caused by high waters in Antelope Creek. Estimated damage was $60,000. In the Beulah area considerable damage resulted from a flash flood that flooded basements, causing damage estimated at $50,000. This flooding was due to 5 to 6 inches of rain.

The James River which had been out of its banks since April in the Columbia and Stratford, S. Dak., reach, fell below flood stage at Columbia, S. Dak., on the 27th. It was still about a foot over bankfull stage.

The Rock River receded below flood stage at Rock Rapids, Iowa, on July 1 and at Rock Valley, Iowa, on July 2. Heavy rains on the 7-9th caused the Rock River to rise to about a foot below bankfull at Rock Rapids on the 8th and 1.2 ft. above flood stage at Rock Valley, Iowa, on the 10th. The Big Sioux River rose about 4 ft. above flood stage at Hawarden, Iowa, on July 1 and 2.3 ft. above flood stage at Akron, Iowa, on July 2. The total flood damages were estimated near $600,000.

Frequent thunderstorms during the latter part of June through the middle of July over northwestern Iowa caused flooding over the upper and middle reaches of the Little Sioux River during the first half of July. The Platte River near Grand Island, Nebr., crested 0.4 foot above flood stage on July 3.

Flooding in Kansas and Missouri was due to several periods of heavy rain which began on June 22 and continued through the entire month of July. Areas with excessive rainfall were located in northeast and central Missouri. Flooding along the main stem of the Missouri was confined mostly to the reach at and below Lexington, Mo. Extensive flood damage occurred to farm crops in the area adjoining the Missouri River. To the south of the Missouri River from southwest Missouri into south-central Missouri, July rainfall of 1 to 2 inches was well below normal with near drought conditions in some areas.

Ohio Basin.--A flash flood occurred on Mountain Creek and Georges Creek in Fayette County, Pa., from excessive rain on July 11. The area of heaviest rain was in the Ruble Mill, Pa., area near Smithfield. The U. S. Corps of Engineers at Pittsburgh, who conducted a bucket survey in the area on July 14, found several reliable samples of rainfall of at least 6 inches. They believe 8 to 9 inches may have occurred over a small area. Most of the rain fell in a 35-minute period between 3:30 p.m. and 4:05 p.m. on the 11th. The small normally dry valley that flows northward toward Ruble Mill was a raging torrent. Water rose about 4 ft. in the building that housed the General Store, causing $25,000 to $30,000 damage. This building had been there 60 to 75 years and had never experienced any flooding of the magnitude before. Homes were surrounded and slightly damaged along Georges Creek. The total damages from the flash flood will probably range from $50,000 to $100,000.

One of the most severe floods in northern Ohio resulted from excessive rainfall during the night of July 4 and the morning and early afternoon of July 5. It occurred in an area about 20 miles on either side of a line running between Toledo, Ohio, and Wheeling, W. Va., with rainfall greater than 10 inches around Wooster, Ohio, and Norwalk, Ohio. Preliminary bucket surveys and reports from other official rain gages indicated that up to 14 inches of rain occurred in certain localities. This precipitation caused flooding which resulted in heavy loss of life and considerable crop and property damage in a dozen Ohio counties. The hardest hit communities were Wooster, Ashland, Millersburg, Loudonville, and Killbuck, Ohio, in the Ohio Basin and Norwalk and Vermillion in Great Lakes Drainage. Of the 46 fatalities reported in this storm, 30 were due to the floods. The total flood damages were estimated between $70 million and $140 million. Preliminary figures indicate that 7,000 trucks and automobiles, with an insured value of $24 million were damaged or destroyed. In Wayne County alone, 26 bridges were completely destroyed while 110 were put out of commission.

Intense rain during the evening of July 22 caused flash flooding on Elkhorn Creek, a tributary of Tug Fork of Big Sandy River. Considerable damage occurred in the towns of Elkhorn and Powhatan, W. Va. The total damages were estimated at over $100,000. Some 20 homes in Oak Hill, W. Va., on Arbuckle Creek were flooded during the evening of the 22d. The Fayette County Agricultural Agent estimated the damage at $30,000.

Thunderstorms late on the 19th and early on the 20th caused local flooding on the Scioto River at La-Rue, Ohio, on the 20th. No damage resulted.

Flash flooding occurred in the White River Basin at Greenwood, Ind., on July 20. The flooding developed rapidly as 9.04 inches of rain fell in less than 9 hours. Although the center of heavy rainfall was quite small, an area receiving in excess of 3 inches was quite extensive and covered a considerable portion of the White River from Martinsville to north of Indianapolis, Ind. The headwater tributaries of the East Fork above Columbus, Ind., received much more than 3 inches. As a result of the rains, normally dry streams spread over large areas and streets in both Greenwood and Franklin. The water ran several feet deep in many places. Fifteen or 20 boats were utilized in evacuating some 35 families in Greenwood. Riverside Drive, south of Greenwood, was under 20 ft. of water in some areas. Several bridges were washed out. More than 50 mobile homes were overturned and damaged by raging waters. At least 35 dwellings were damaged in Greenwood and numerous homes were flooded in Franklin. About 400 to 500 people were forced to leave their homes. Local residents of Greenwood said the rainfall was the heaviest within memory. Rains of 4 inches or more on the morning of the 22d caused flash flooding in an area from just south of Martinsville to Columbus, Ind. A bridge on State Road 37, south of Martinsville, was washed out. These heavy rains caused flooding on the East Fork at Columbus and Seymour, Ind., and

along the lower portion of the White. Roads were closed in numerous areas by flash flooding and overflow of larger rivers. Many farmers suffered heavy losses to corn and soybean crops.

White Basin.--Minor flooding occurred on Cache River at Patterson, Ark., on the 1st-4th. This overflow was due to 1- to 2-inch rains during the last week of June.

Arkansas Basin.--Rainfall averaging 2.5 to 4.5 inches in the Neosho Basin above Chanute, Kans., on the morning of the 1st caused local moderate flooding along the Neosho River, mainly below John Redmond Reservoir. Some minor flooding occurred along the Neosho River later in the month. Red Rock Creek, west of Red Rock, Okla., was reported out of banks for a short time.

Light to moderate flooding occurred in north-central Oklahoma on the 7th due to an 8-inch rain late on the 6th.

Torrential rains over a small area of west-central Arkansas on the 25th and 26th caused flash flooding of the smaller streams and a sharp rise on the Petit Jean and upper Poteau Rivers.

The precipitation totaled as much as 11.75 inches in 12 hours at Parks, Ark. The Petit Jean River at Danville, Ark., rose 16.6 ft. in 24 hours and crested 2.7 ft. above flood stage on the 27th. Numerous creeks in the Waldron area, some of which empty into the Poteau River, and some into the Petit Jean and Fourche La Fave Rivers, were out of banks for a few hours on the 26th. Water reached a depth of 4 feet on Waldron's main street, flooding most of the town's businesses. Oldtimers said water had not been so deep in 60 years. The editor of the "Waldron News", after a preliminary survey, has estimated damages in excess of $200,000 in Scott County, of which about $100,000 was damage to county roads and bridges.

GULF OF CALIFORNIA DRAINAGE

Colorado Basin.--Heavy precipitation caused some flooding near Emery and Ferron, Utah, on the 19th. The precipitation ranged from 1.43 inches at Emery to 1.79 inches at Panguitch, Utah, (followed by 2.33 inches on the 20th). Only minor damage resulted.

Heavy precipitation during the early morning hours of the 24th over the Head of Cedar Ridge Canyon (about 10 miles northwest of Richfield, Utah,) caused the Sevier Valley Irrigation Canal to overflow its banks for several miles. Over 300 acres were flooded with major damage to open pit Salt Mine. Minor flooding of roads was reported on the same date in southwest Colorado near Cortez and Mancos.

Heavy rain on the 31st caused flooding and mud slides through the residential area of Telluride, Colo. Six homes were destroyed and 15 to 20 more damaged by mud and flood waters. There were no injuries or deaths.

Great Basin.--Heavy precipitation during the evening of the 29th caused street flooding in Salt Lake City, Utah. Over 1 inch of rain was recorded in less than 1 hour (6:30 p.m.-7:30 p.m.). The total storm precipitation was 1.45 inches. The usual nuisance damages were noted in the areas of heaviest rain. At Bountiful, Utah, where 1.75 inches of rain was recorded, the greatest damage was to a new 4-unit apartment building, where about 3 feet of water accumulated on the lower floor. Thunderstorm activity was prominent in the Great Basin during the closing days of July.

[illegible] for rawinsonde purposes. "Number of observations" refers to those of dy- [illegible] given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes, dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

' Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

• Observations for these stations are scheduled at 0000 G.C.T.

• [illegible] Therefore, due to the lesser number of Dew Point observations at the higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

	No observations due to cloudiness								

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63 of this publication.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

Note.--Langley is the unit used to denote one gram calorie per square centimeter. Values with an asterisk are interpolated.

U Indicates Urban sites.

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

Note.--Langley is the unit used to denote one gram calorie per square centimeter. Values with an asterisk are interpolated.

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a.m.) at Palmer, Alaska

JULY 1969

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
Langleys. . .	245	264	140	157	280	296	134	166	149	237	166	124	112	135	185	275

Date.	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	291	195	170	222	415	251	222	19	195	225	141	33	127	167	226	192

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the ESSA, Weather Bureau.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (< 3900 A) at Ames, Iowa

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
Langleys. . .	22.37	14.56	8.64	19.29	13.73	3.55	6.39	13.26	14.68	18.23	22.14	19.41	20.12	20.36	14.91	17.04

Date.	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	11.95	11.95	9.23	19.53	16.81	16.69	14.91	20.95	13.97	8.52	11.48	17.28	18.70	11.48	15.51	15.08

These data are from an U - V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the ESSA, Weather Bureau.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code as defined in the August 1962 WMO Circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units Milli-atmo-cms

Data will be delayed

DESCRIPTION OF CHARTS

CHART I. A. NORMAL DAILY AVERAGE TEMPERATURE (°F. 1931-60) FOR MONTH. B. TEMPERATURE DEPARTURE FROM 30-YEAR MEAN (°F. 1931-60) FOR MONTH. Chart I-A is reproduced from Environmental Data Service Publication "Climatic Maps of the United States". Chart I-B is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin", a publication of Environmental Data Service.

CHART II. TOTAL PRECIPITATION. Chart II is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin".

CHART III. PRECENTAGE OF NORMAL PRECIPITATION. Chart III is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin".

CHART IV. TOTAL SNOWFALL. CHART V. A. PERCENTAGE OF MEAN MONTHLY SNOWFALL. B. DEPTH OF SNOW ON GROUND. Chart IV gives the total depth in inches of unmelted snowfall as reported during the month by Weather Bureau and selected cooperative stations. This is converted in Chart V-A into a percentage of the mean monthly total amount computed for each Weather Bureau station having at least 10 years of record. The depth of snow on ground is that reported by both Weather Bureau and selected cooperative stations as of 7:00 a.m. Eastern Standard Time on the Monday nearest the end of the month. This is reported only for the months December through March. The snowfall charts are presented each month November through April.

Isolines for Charts I, II, III, IV, and V, are drawn through points of approximately equal value. Caution should be used in interpolating on these charts, particularly in mountainous areas.

CHART VI. A. PERCENTAGE OF POSSIBLE SUNSHINE. B. PERCENTAGE OF MEAN MONTHLY SUNSHINE. Chart VI-A shows the amount of sunshine received in terms of percentage of the total hours of sunshine possible during the month. In Chart VI-B this is shown as a percentage of the mean number of hours of sunshine received. Means are computed for Weather Bureau stations having at least 10 years of record.

CHART VII. A. AVERAGE DAILY VALUES OF SOLAR RADIATION LANGLEYS. B. PERCENTAGE OF MEAN DAILY SOLAR RADIATION. Shown on Chart VII-A are the monthly averages of daily total solar radiation, both direct and diffuse, in langleys (gm. cal. cm.-2) for all Weather Bureau and selected cooperative stations which record this element. The analyses include adjustments required to bring station records to approximately the same level of calibration. Adjusted numbers are in parentheses. Chart VII-B shows the percentages of the mean based on at least 5 years of record during the period 1950-1960, and corrected to the International Pyrheliometer Scale of 1956.

CHART VIII. TRACKS OF CENTERS OF ANTICYCLONES AT SEA LEVEL.

CHART IX. TRACKS OF CENTERS OF CYCLONES AT SEA LEVEL. Centers which can be identified for 24 hours or more are tracked in these charts. Semipermanent features such as the Great Basin and Pacific Highs and Colorado and Mexico Lows are not shown. The 7:00 a.m. EST positions are shown by open circles, with the intermediate positions at 6-hour intervals shown by solid dots. The date is given above the circle and the central pressure to whole millibars below. A dashed track indicates a regeneration rather than actual movement to the next position. Solid squares indicate position of stationary center for period shown beside it.

CHART X. AVERAGE SEA LEVEL PRESSURE (mb.) AND RESULTANT SURFACE WIND. The average monthly sea level pressures are obtained from eight daily 3-hourly observations reported at Weather Bureau Stations. Resultant surface wind directions (to 36 points of the compass) for the month are shown by arrows. Resultant speeds are in miles per hour and are indicated by the length of arrow shafts. Constancy ratios (resultant surface wind divided by average surface wind for month) are shown to two decimal places. The inset shows the departure of the average pressure based on 30-year normals for first-order Weather Bureau Stations, other stations having at least 10 years of record; and for each 10° intersection in a diamond grid over the oceans.

CHARTS XI-XVI. AVERAGE HEIGHT, TEMPERATURE, AND RESULTANT WINDS, 850, 700, 500, 300, 200, and 100 mb. Height is given in geopotential meters and temperature in degrees Celsius. These are the averages of the 1200 GMT radiosonde reports. Wind speeds are given in meters per second; flag represents 25 m.p.s., full feather 5 m.p.s., and half feather 2 1/2 m.p.s. Directions are shown to 360° of the compass. Winds are based on rawins at the indicated pressure surface and at 1200 GMT.

CHART XVII. A. 50-MB. RESULTANT WINDS. B. 30-MB. RESULTANT WINDS. Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. Winds are based on rawins at the indicated pressure surface and at 1200 GMT.

Exact values of most of these charted elements for Weather Bureau stations are printed each month in tabular form in CLIMATOLOGICAL DATA, NATIONAL SUMMARY. Extreme values of temperature and precipitation for each state are included in the tables, Condensed Climatological Summary. Annual averages for surface elements are presented in the CDNS Annual Issue each year.

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), July.

B. Temperature Departure from 30 - Year Mean (°F 1931-60), July 1969.

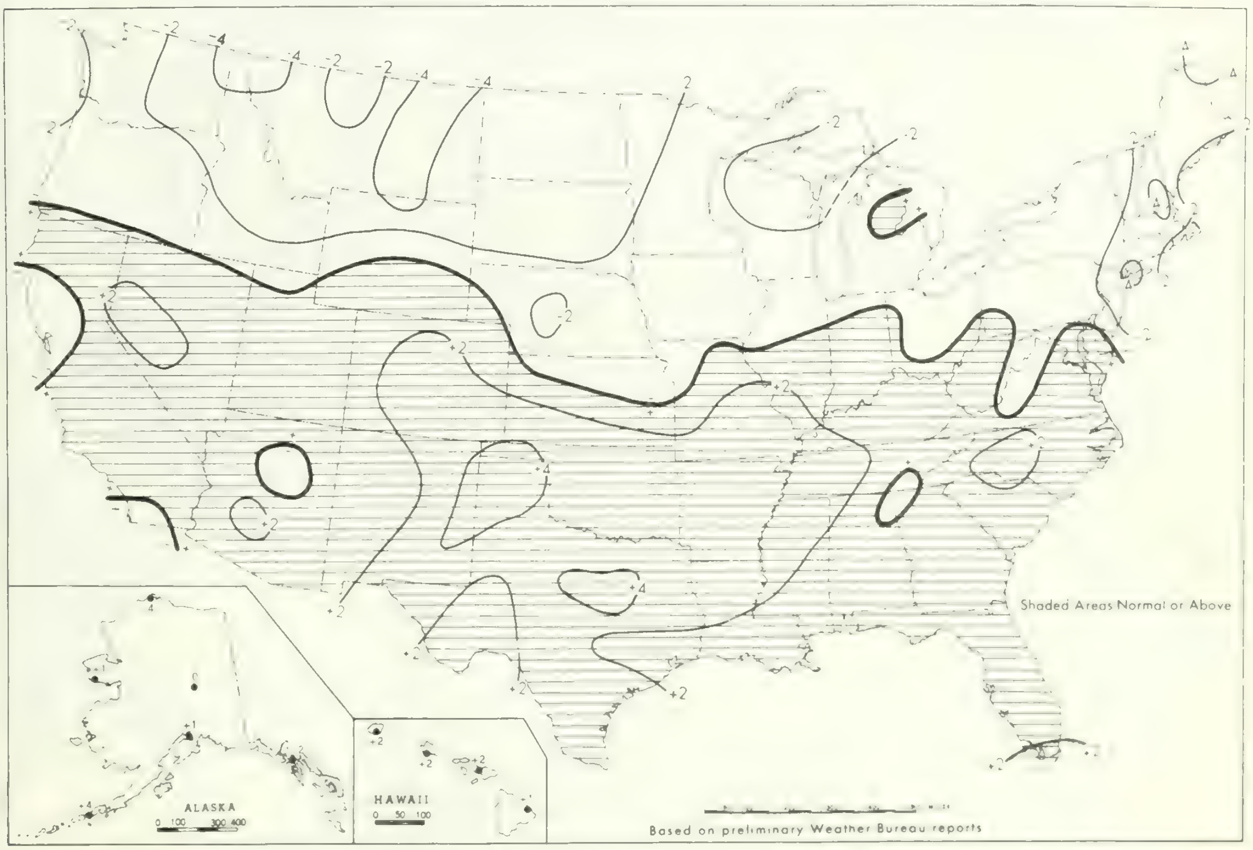

Chart II. Total Precipitation (Inches), July 1969.

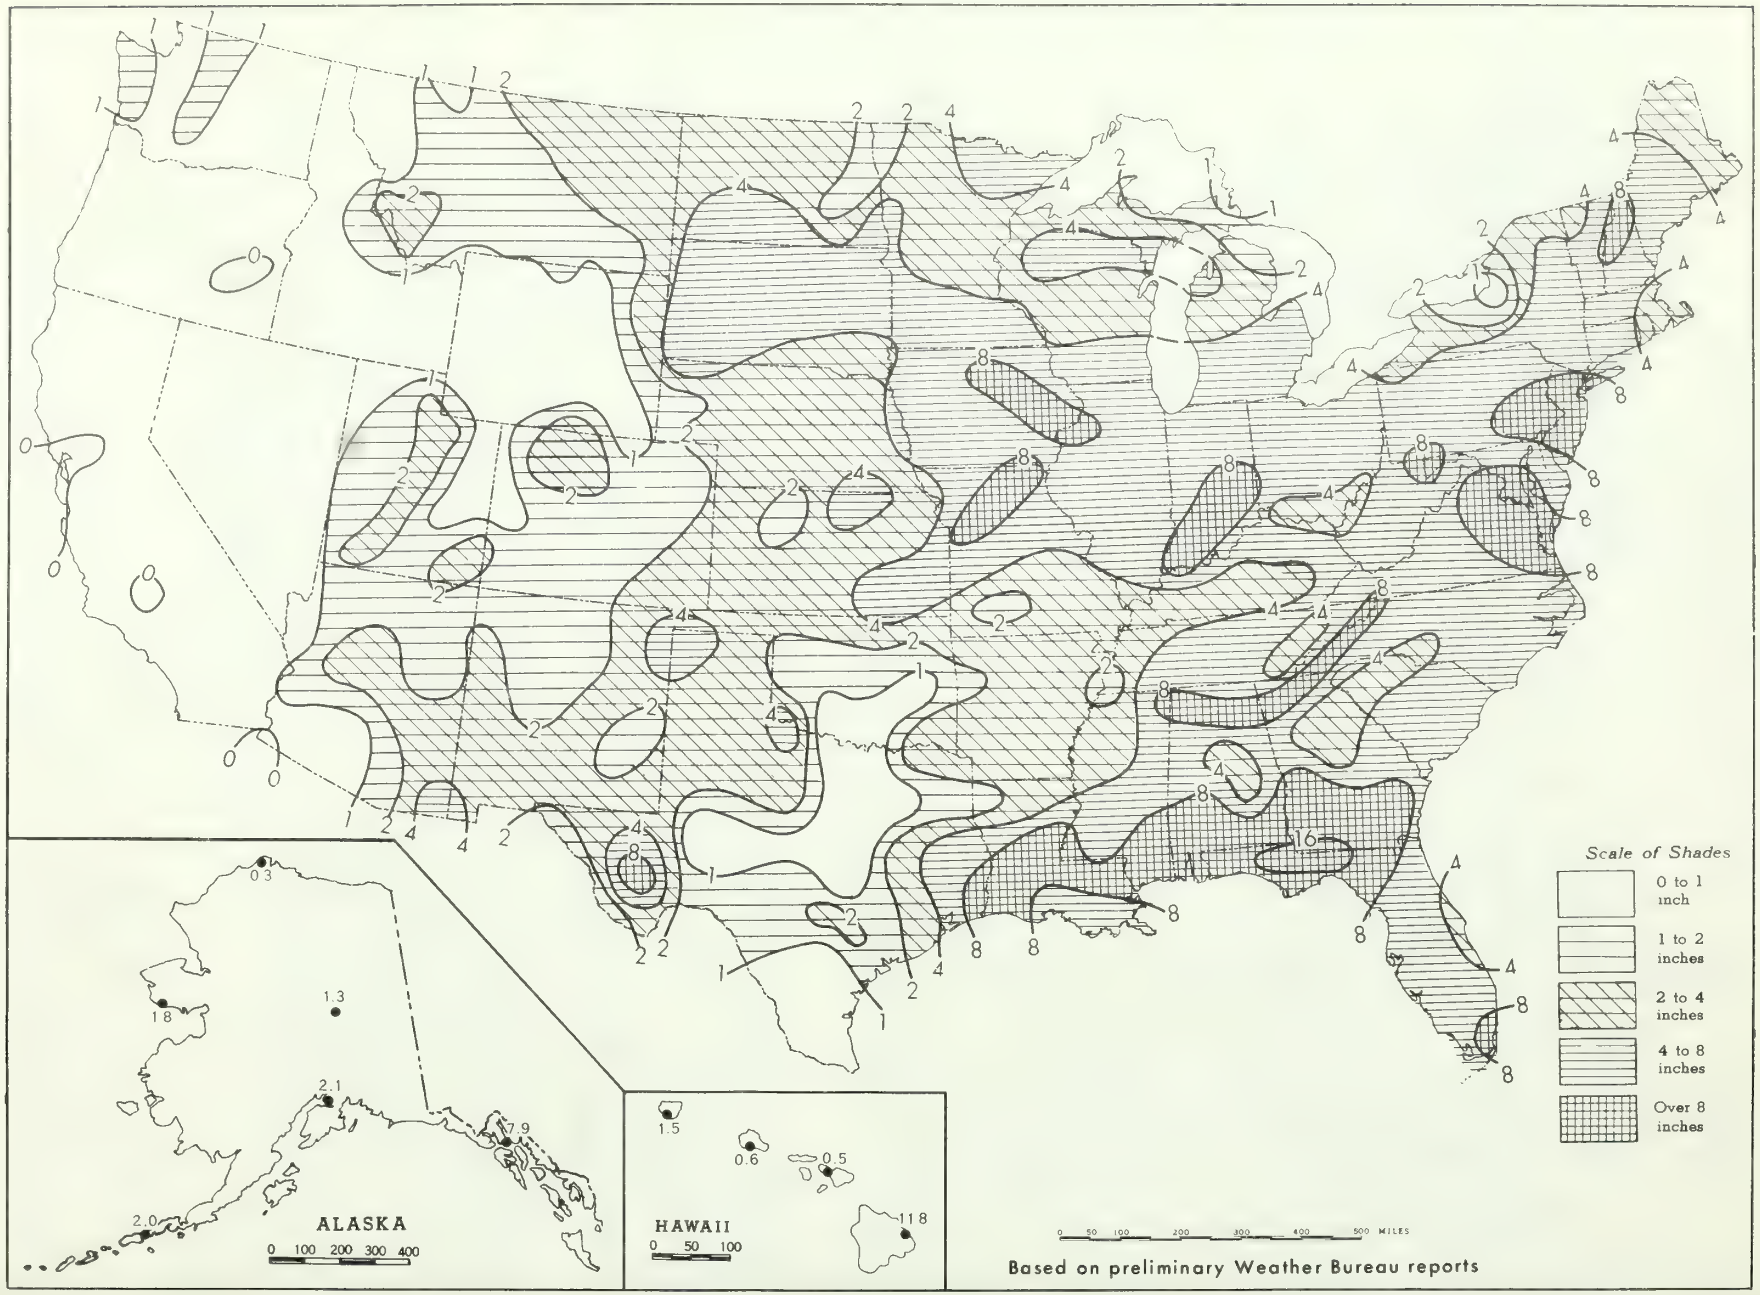

Chart III. Percentage of Normal Precipitation, July 1969.

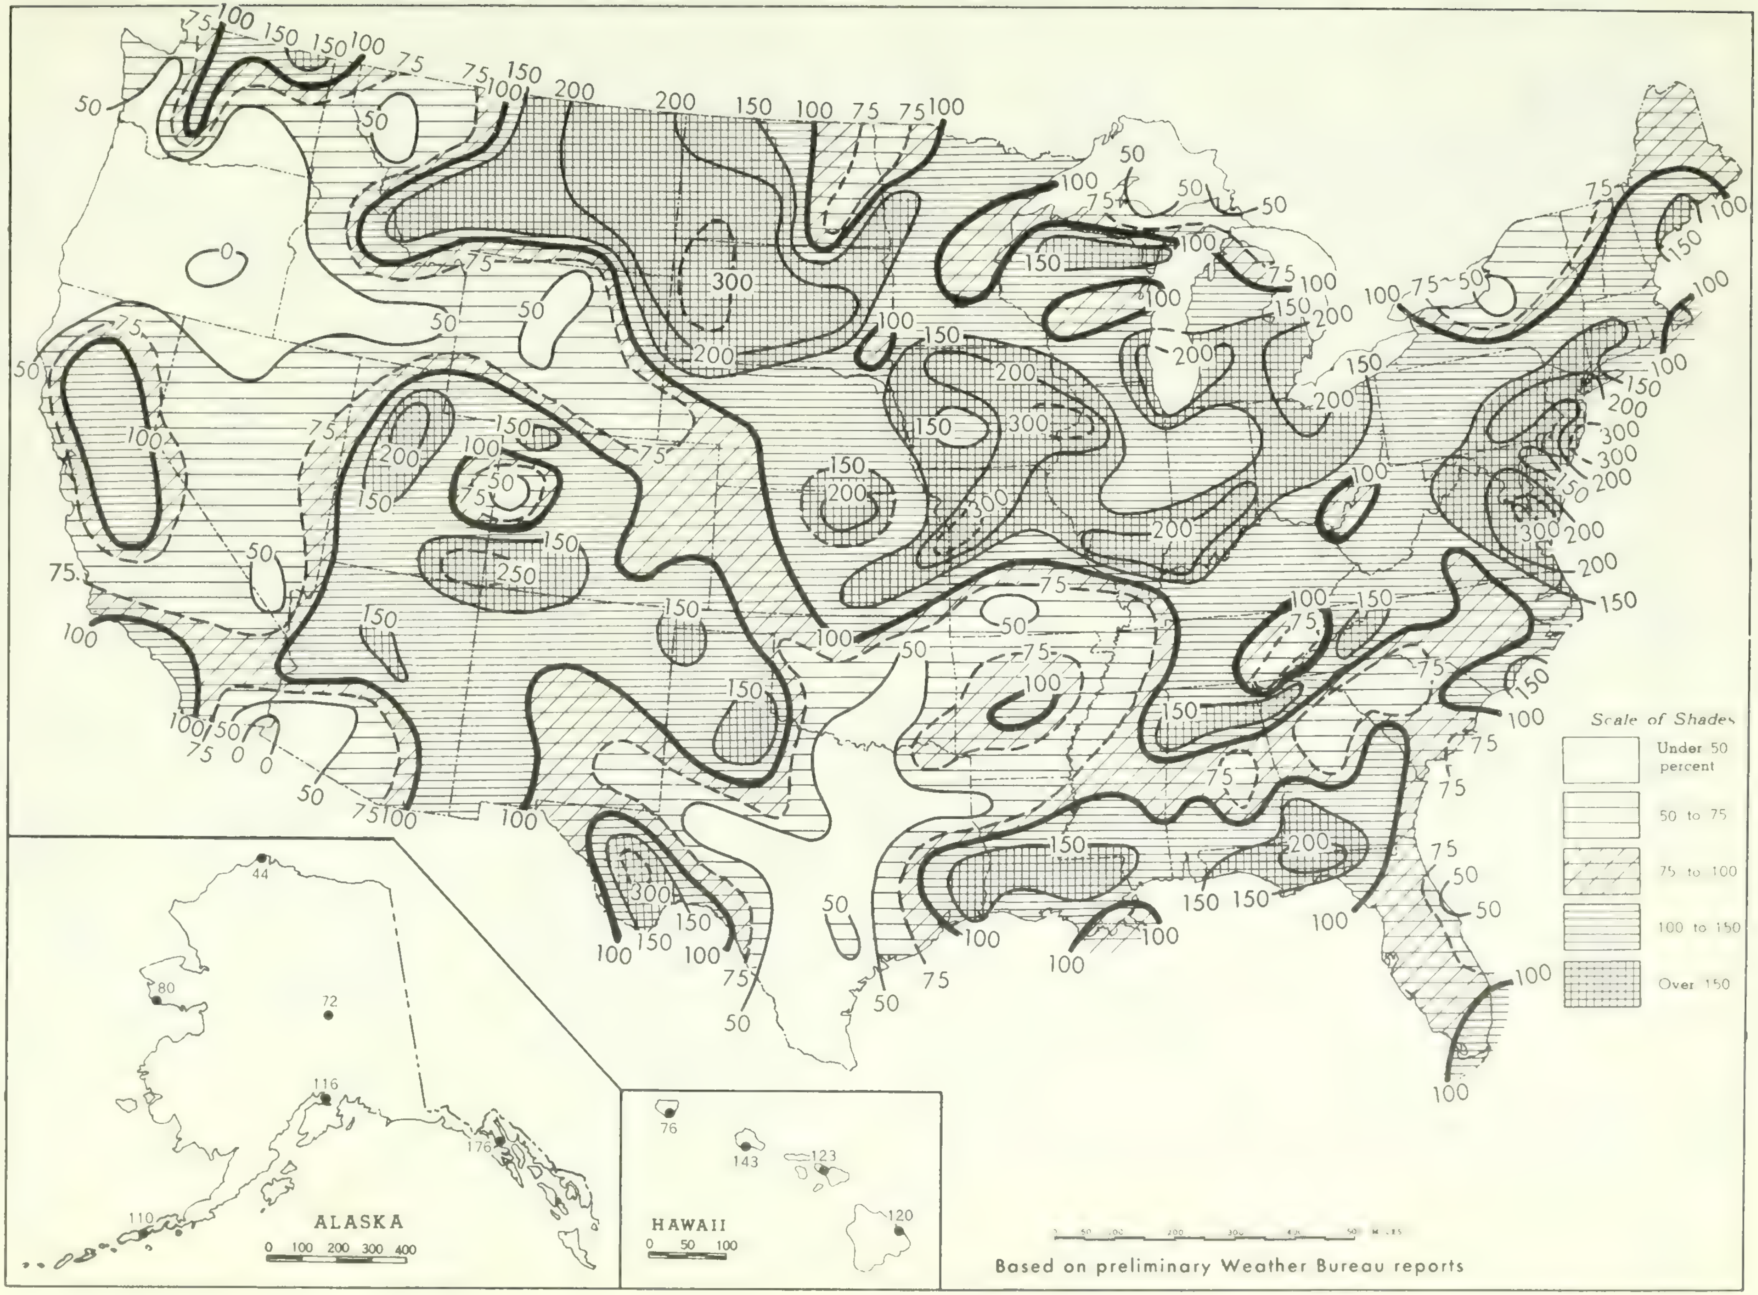

Chart VI. A. Percentage of Possible Sunshine, July 1969.

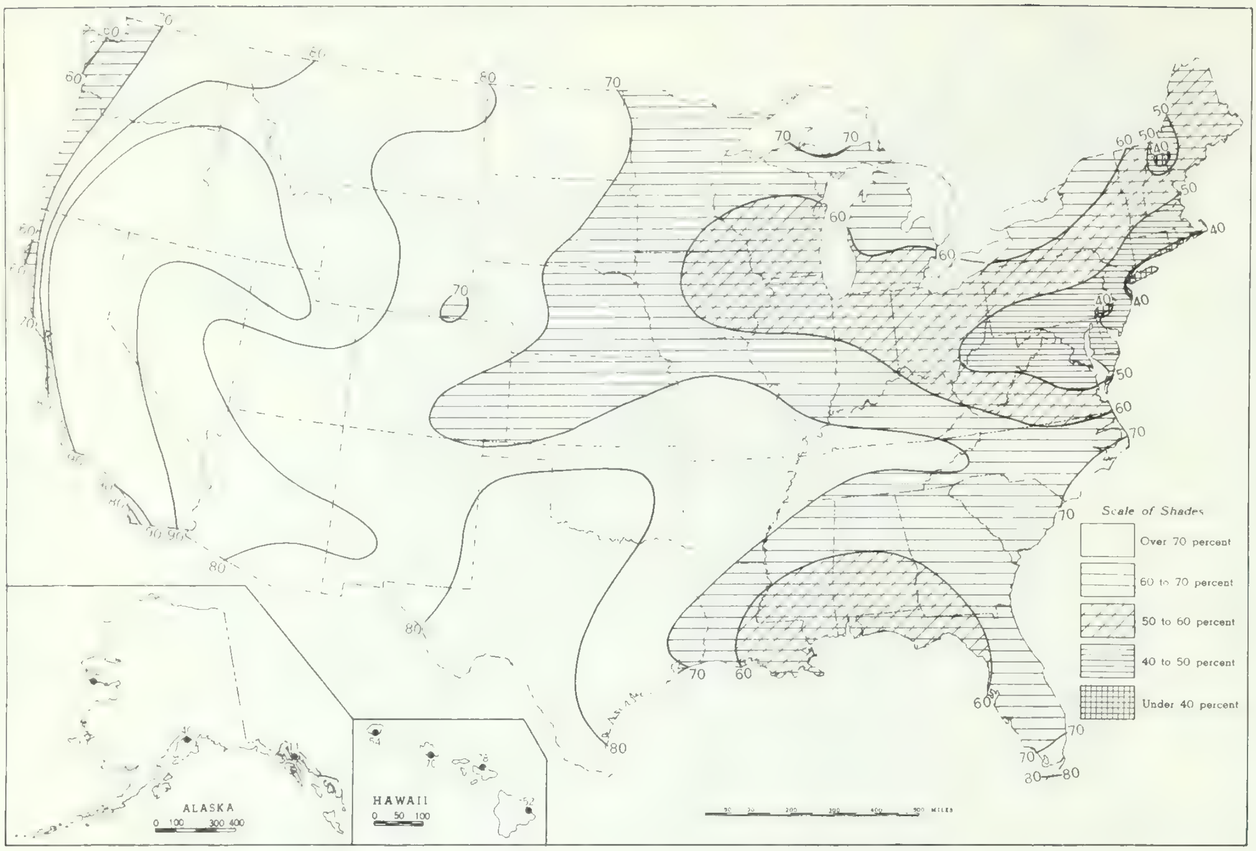
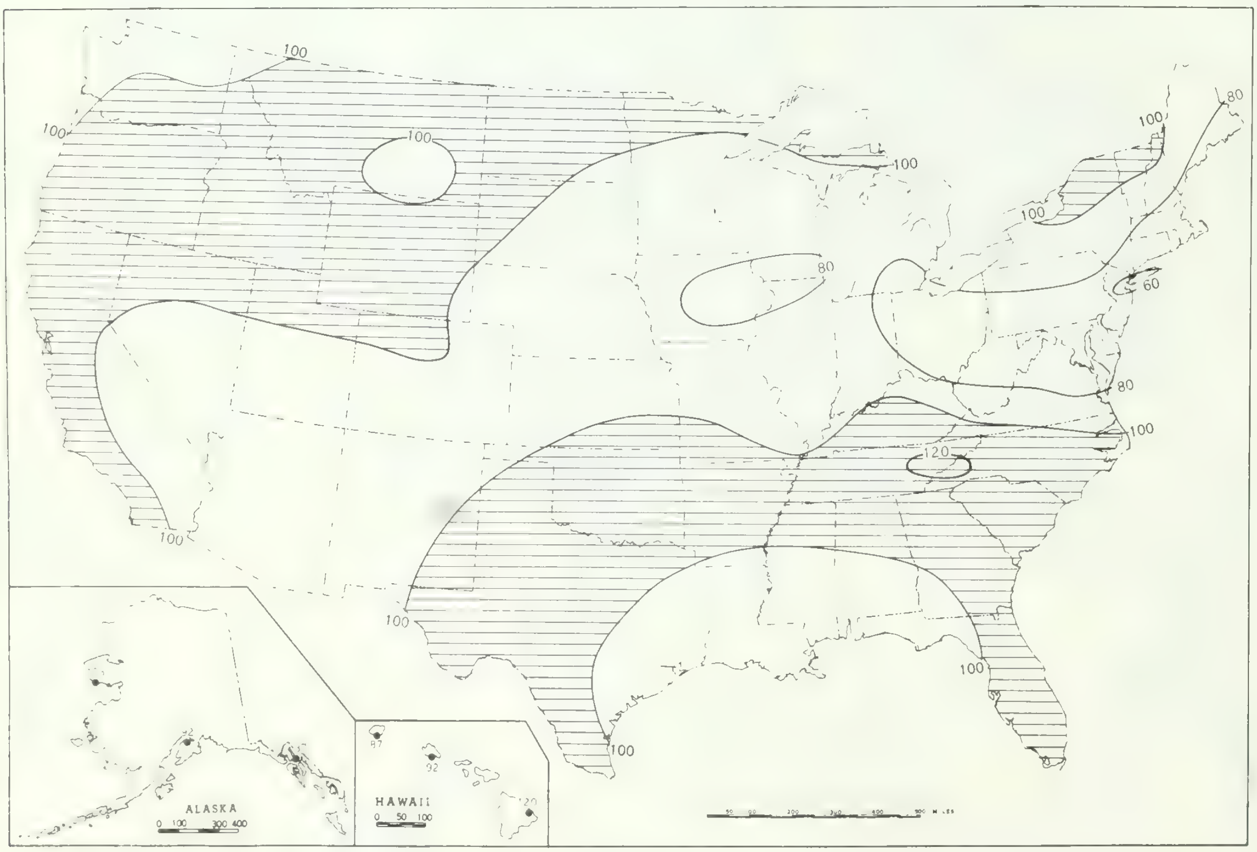
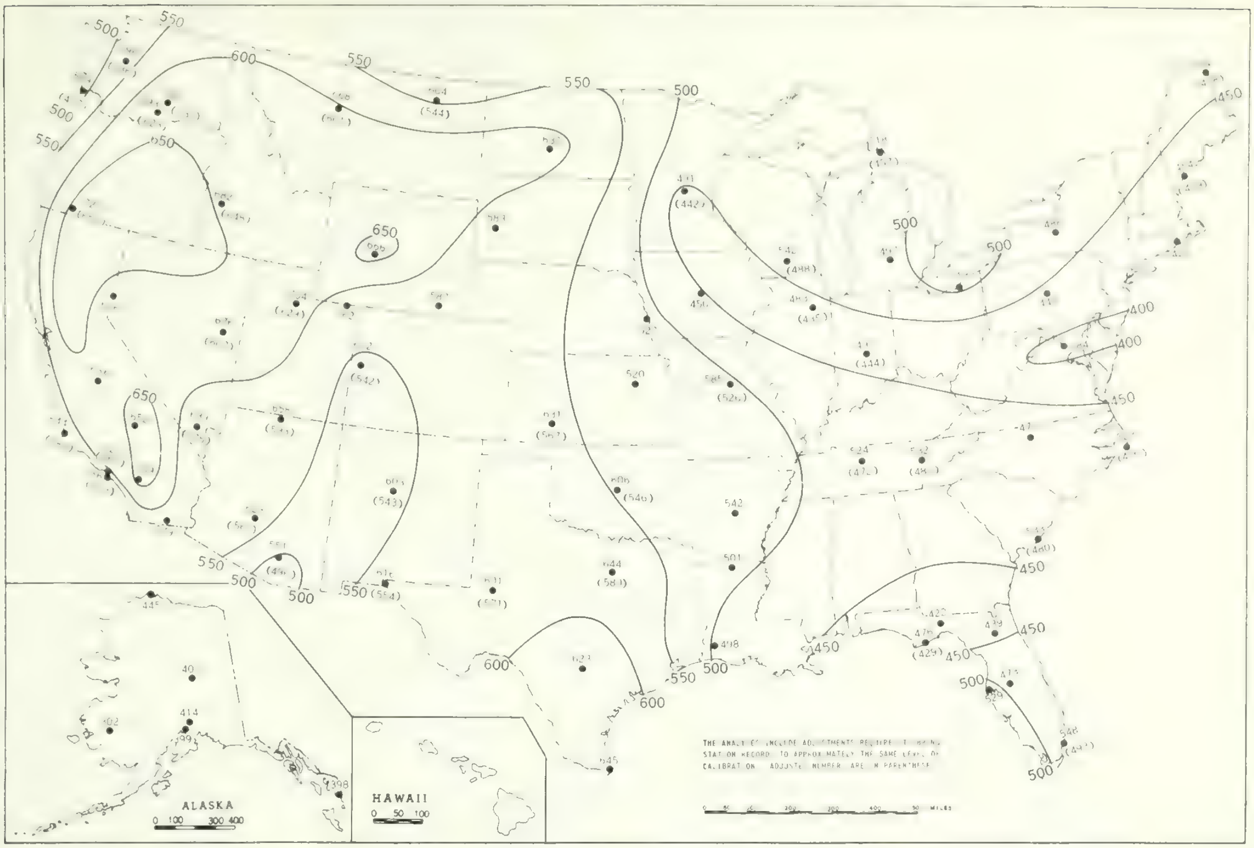


B. Percentage of Mean Monthly Sunshine, July 1969.

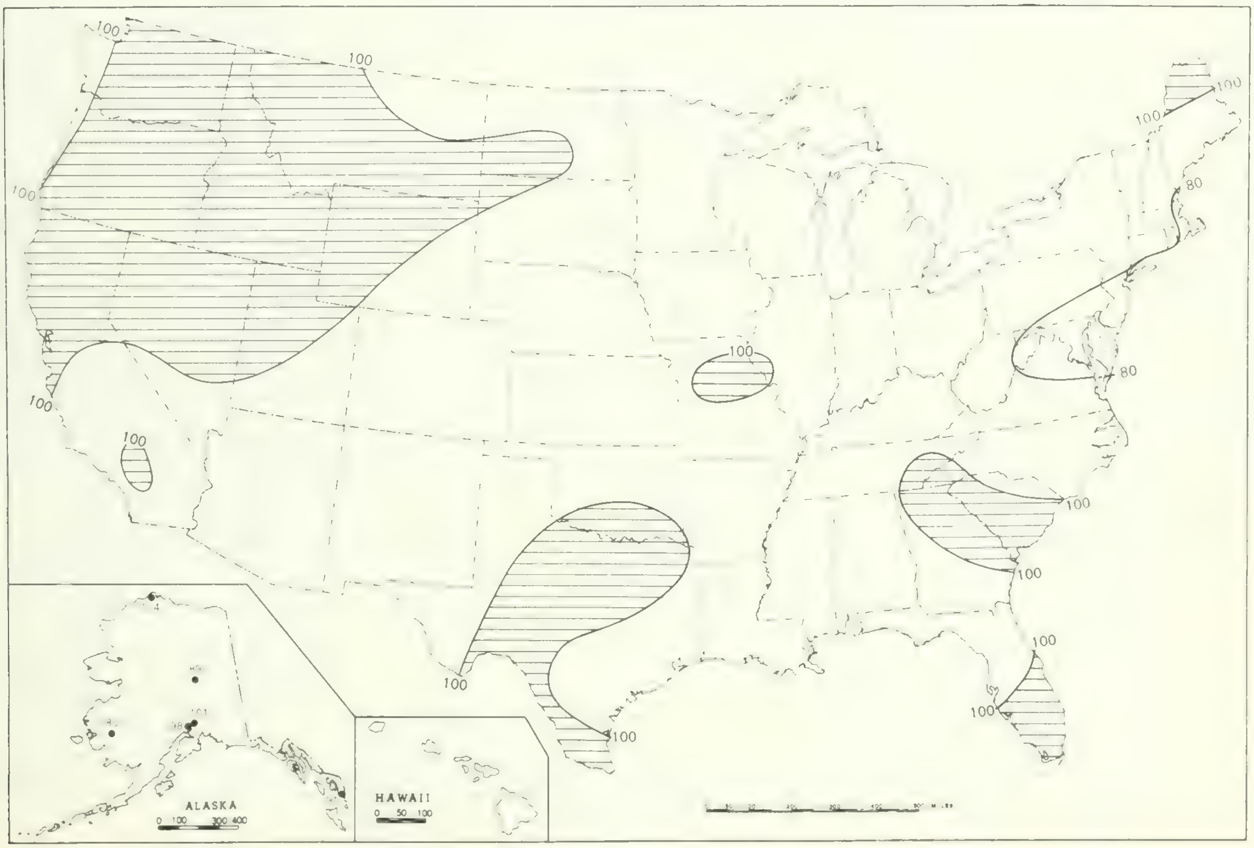


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, July 1969.

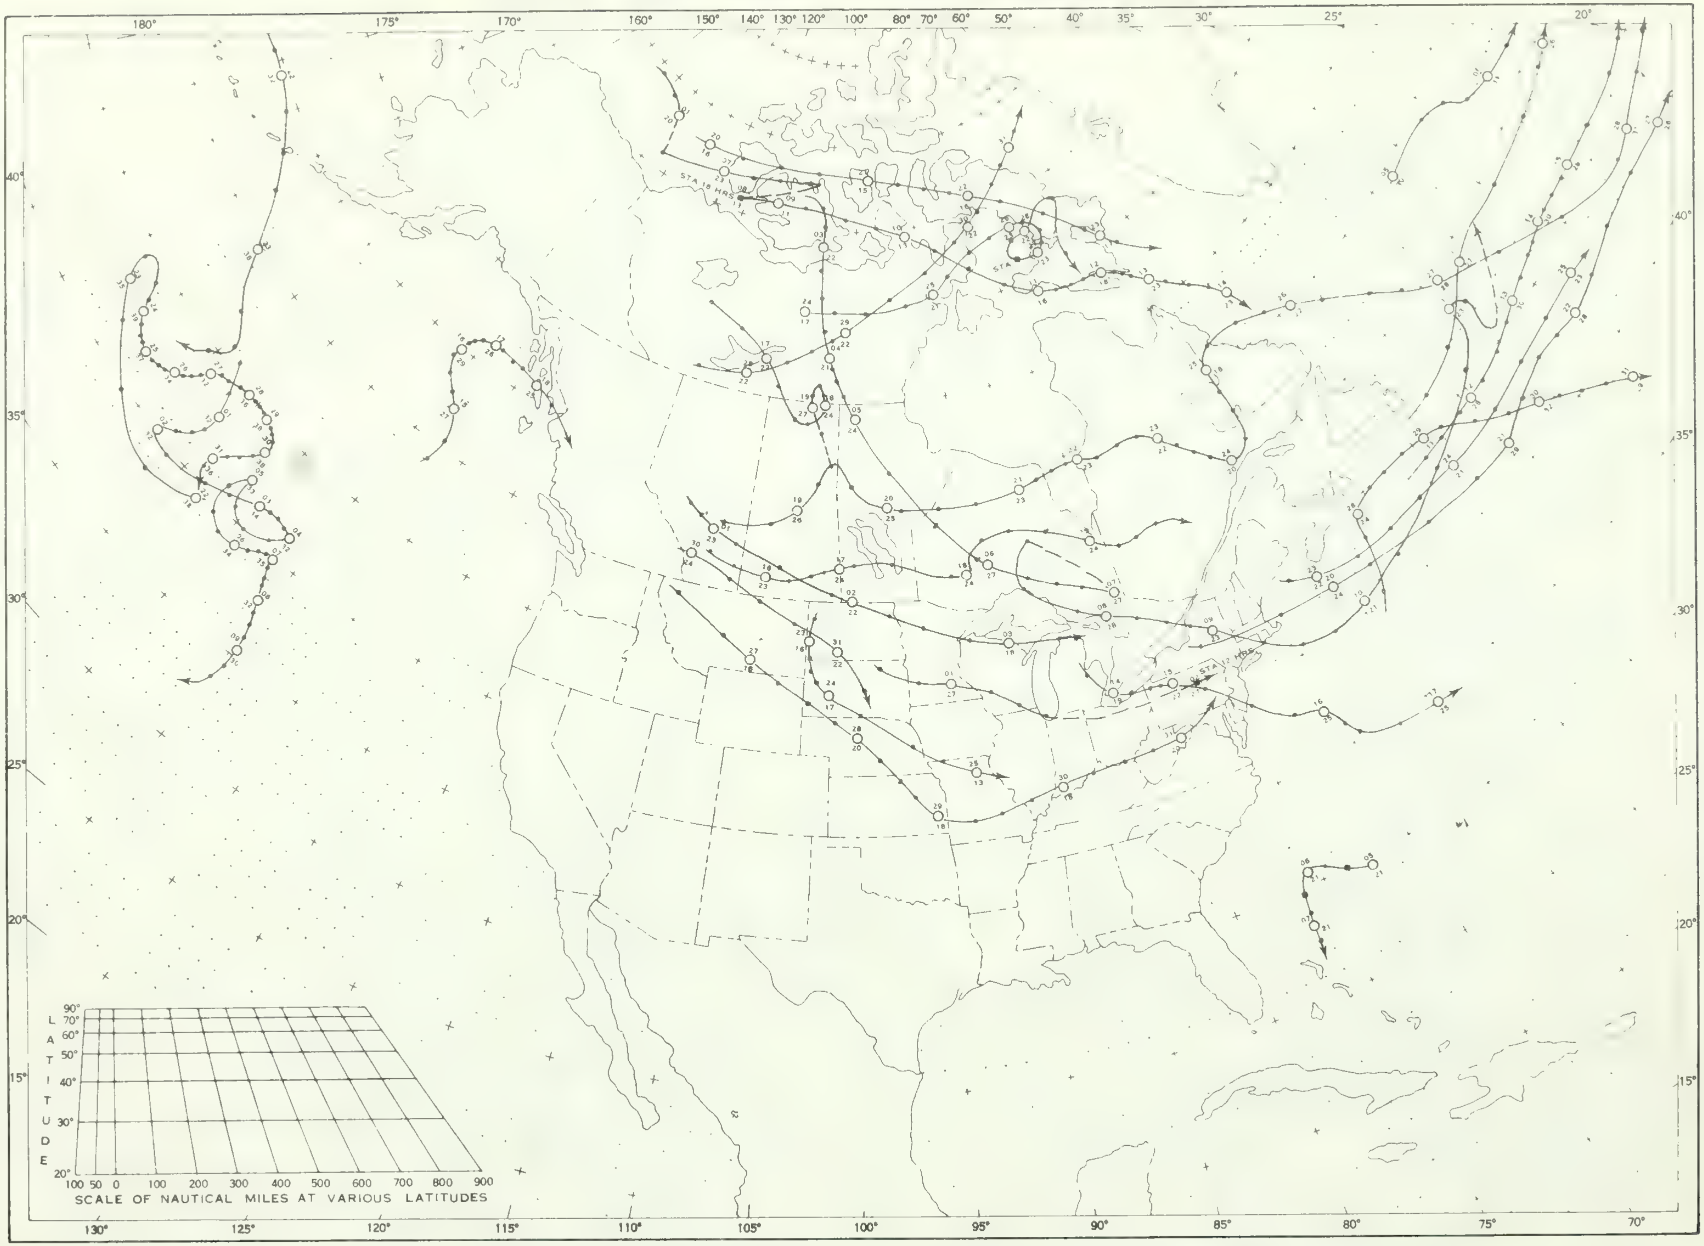


B. Percentage of Mean Daily Solar Radiation, July 1969.



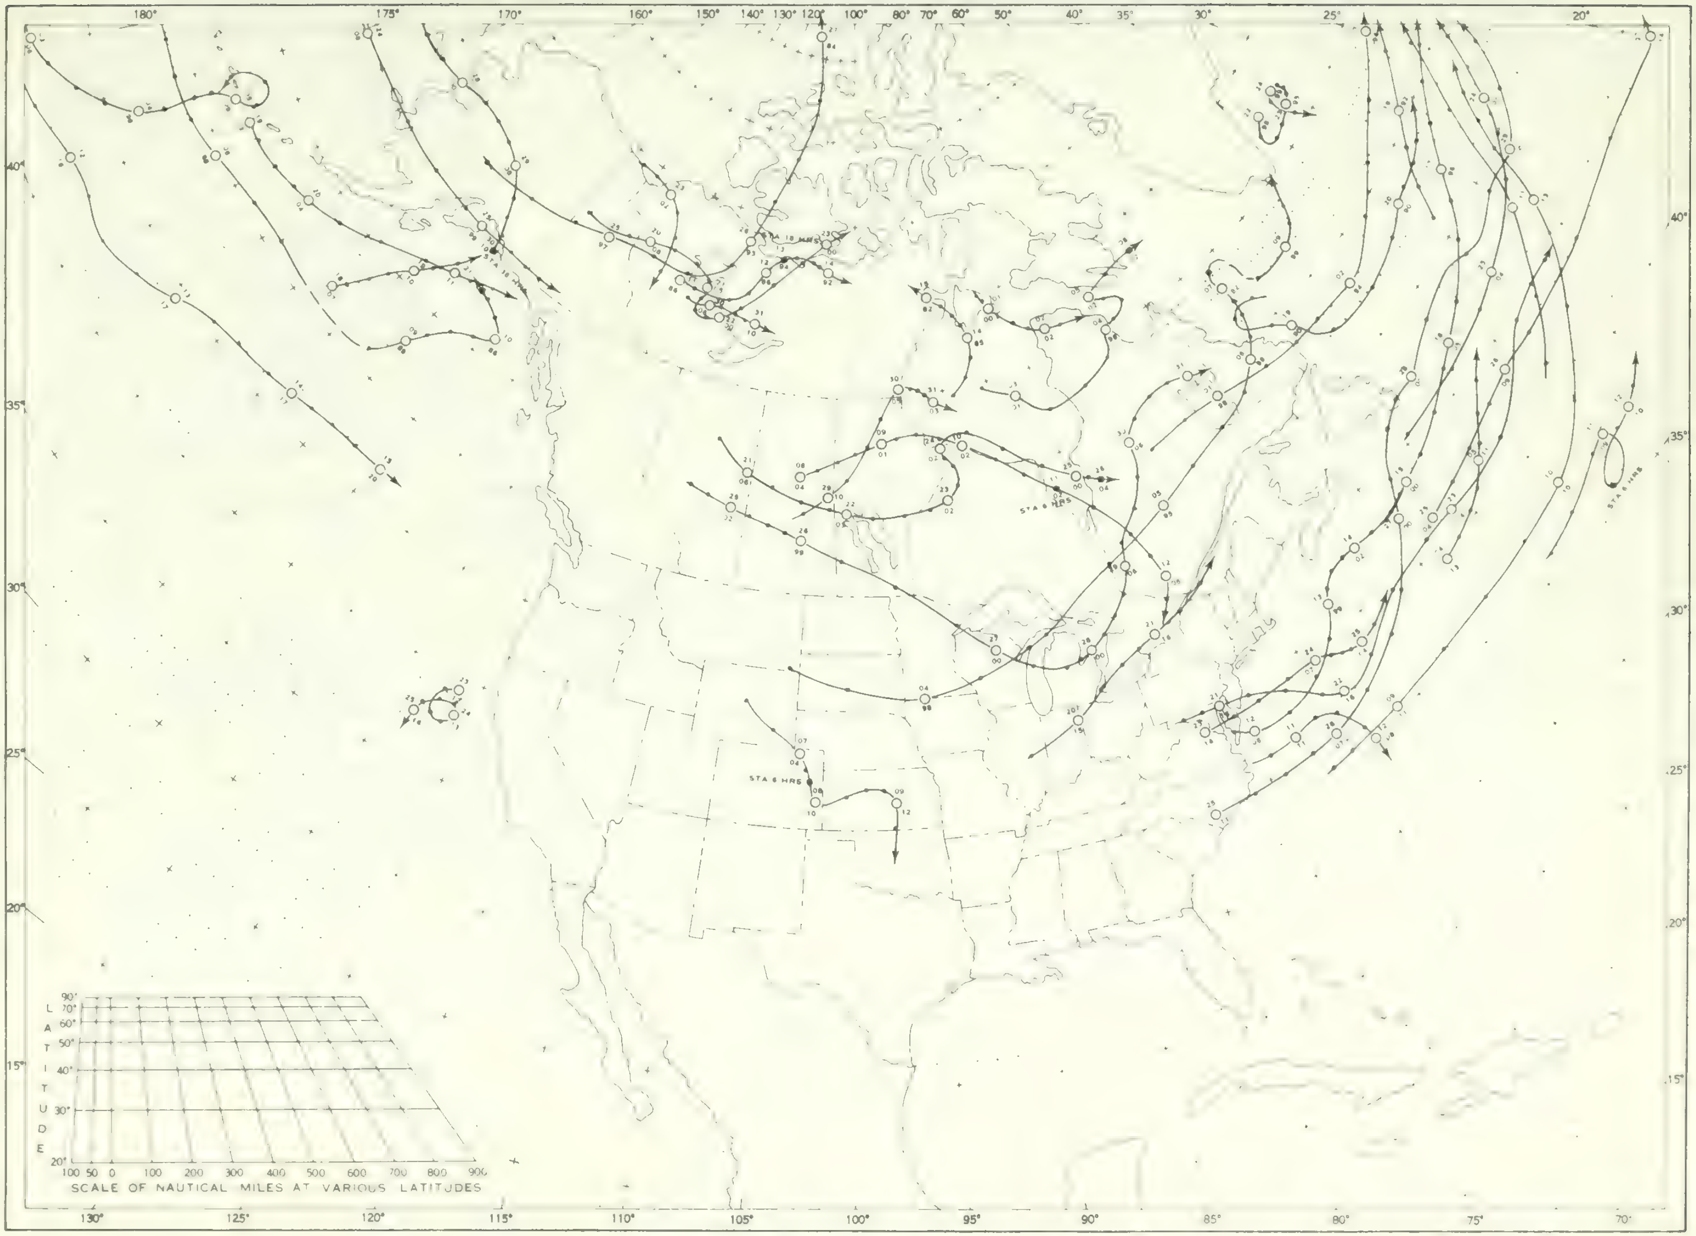
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm. $^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, July 1969.



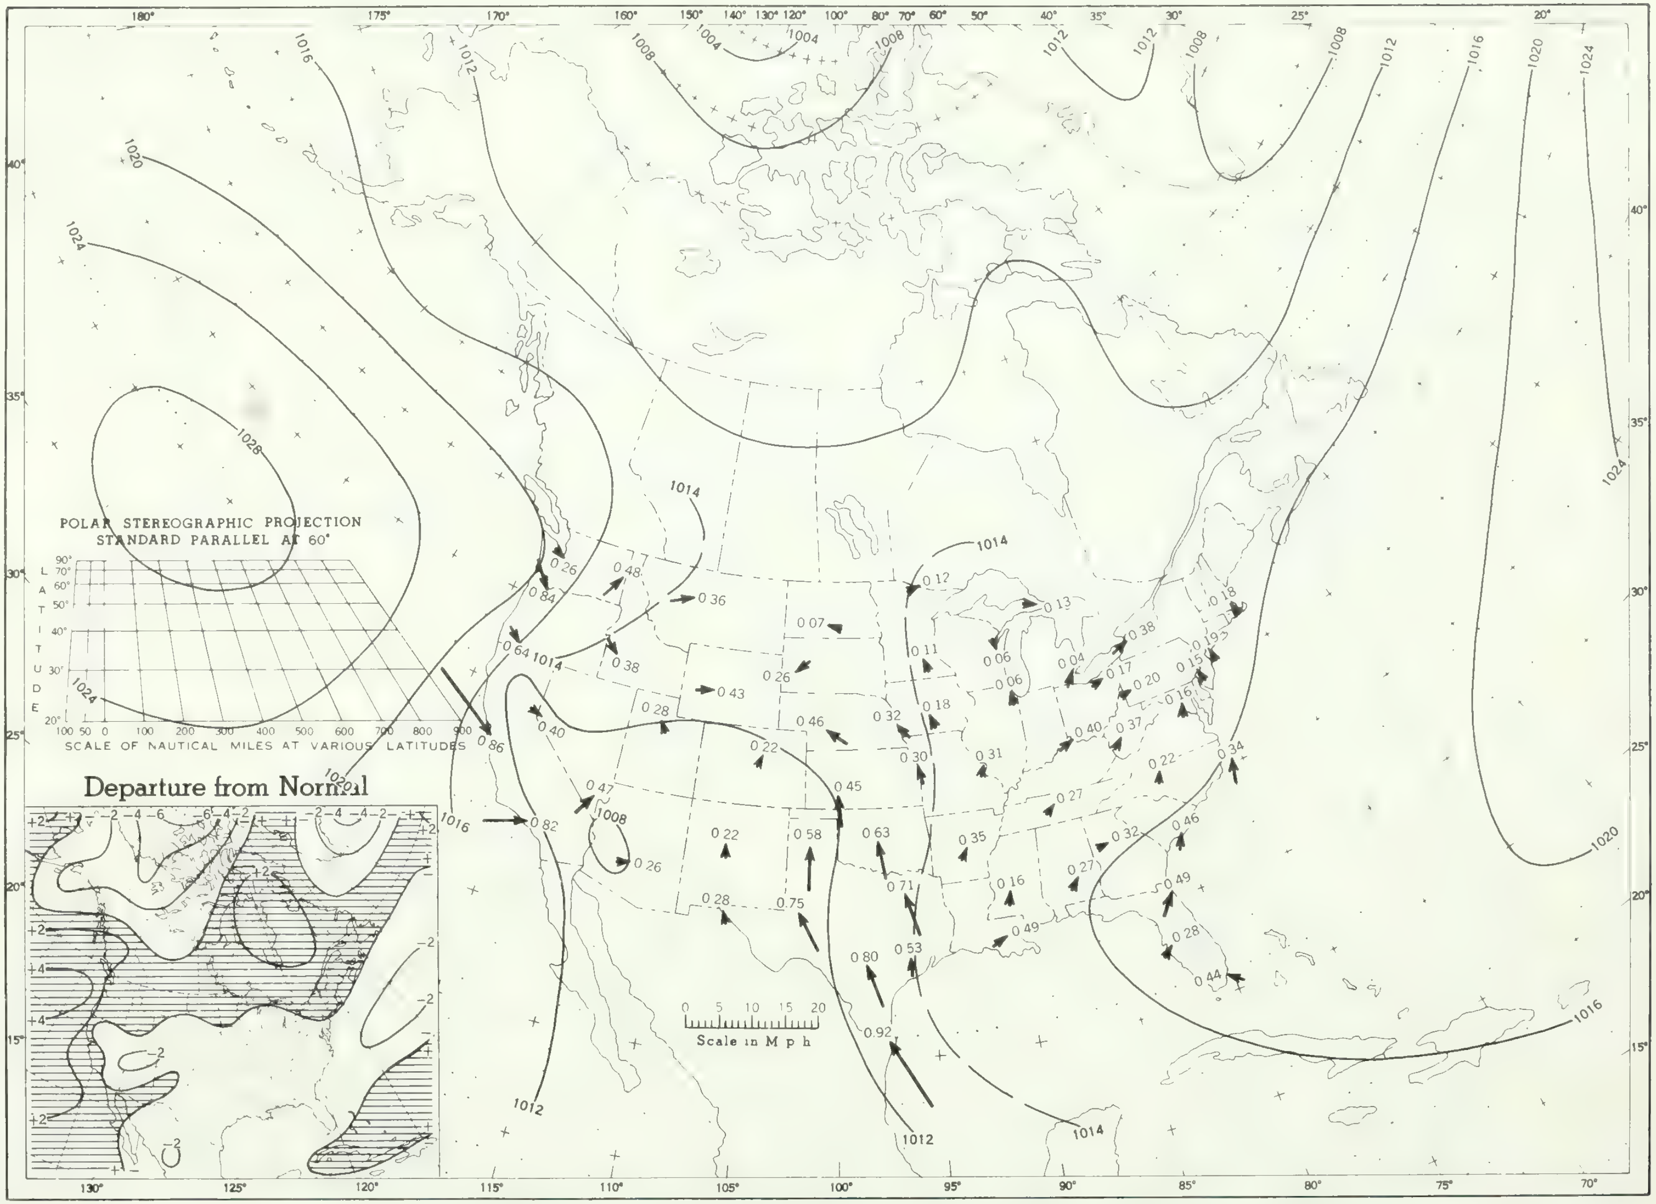
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, July 1969.



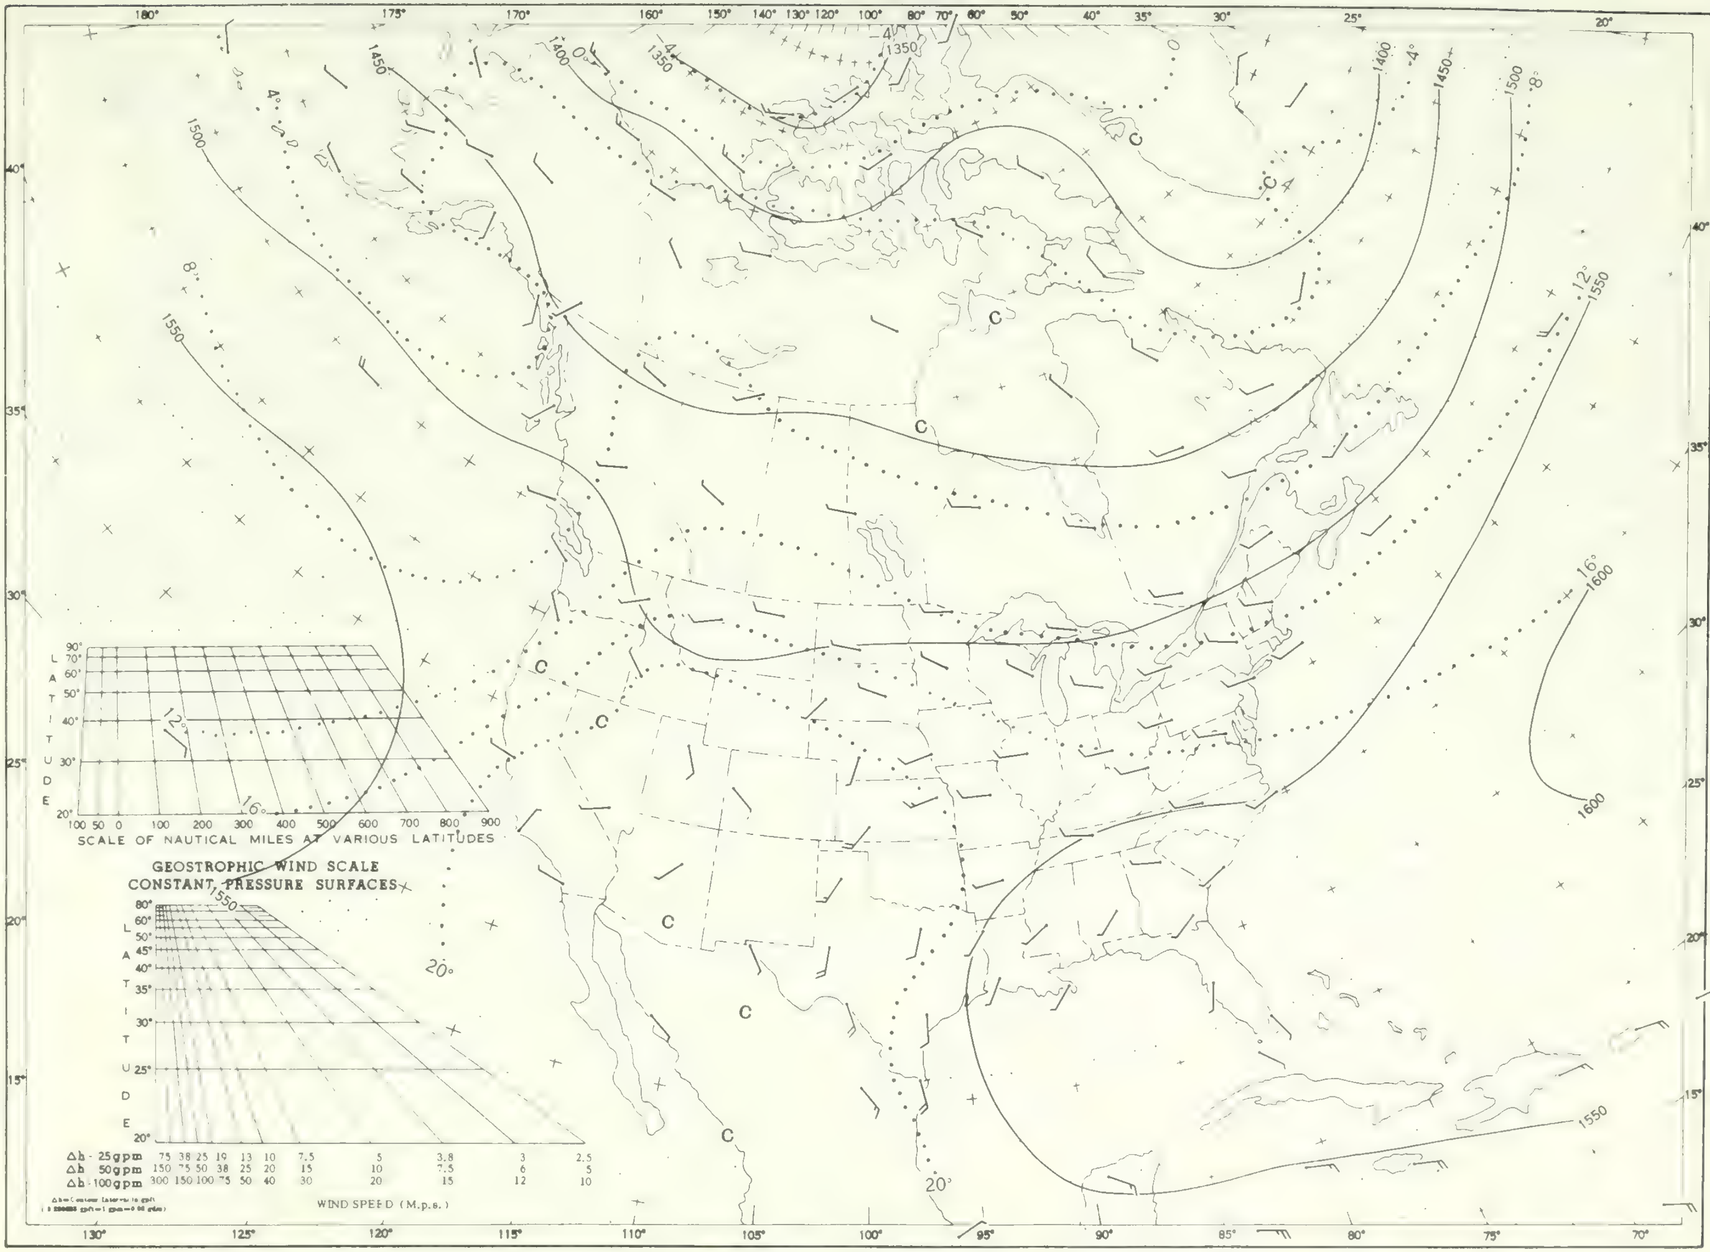
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, July 1969. Inset: Departure of Average Pressure (mb) from Normal, July 1969.



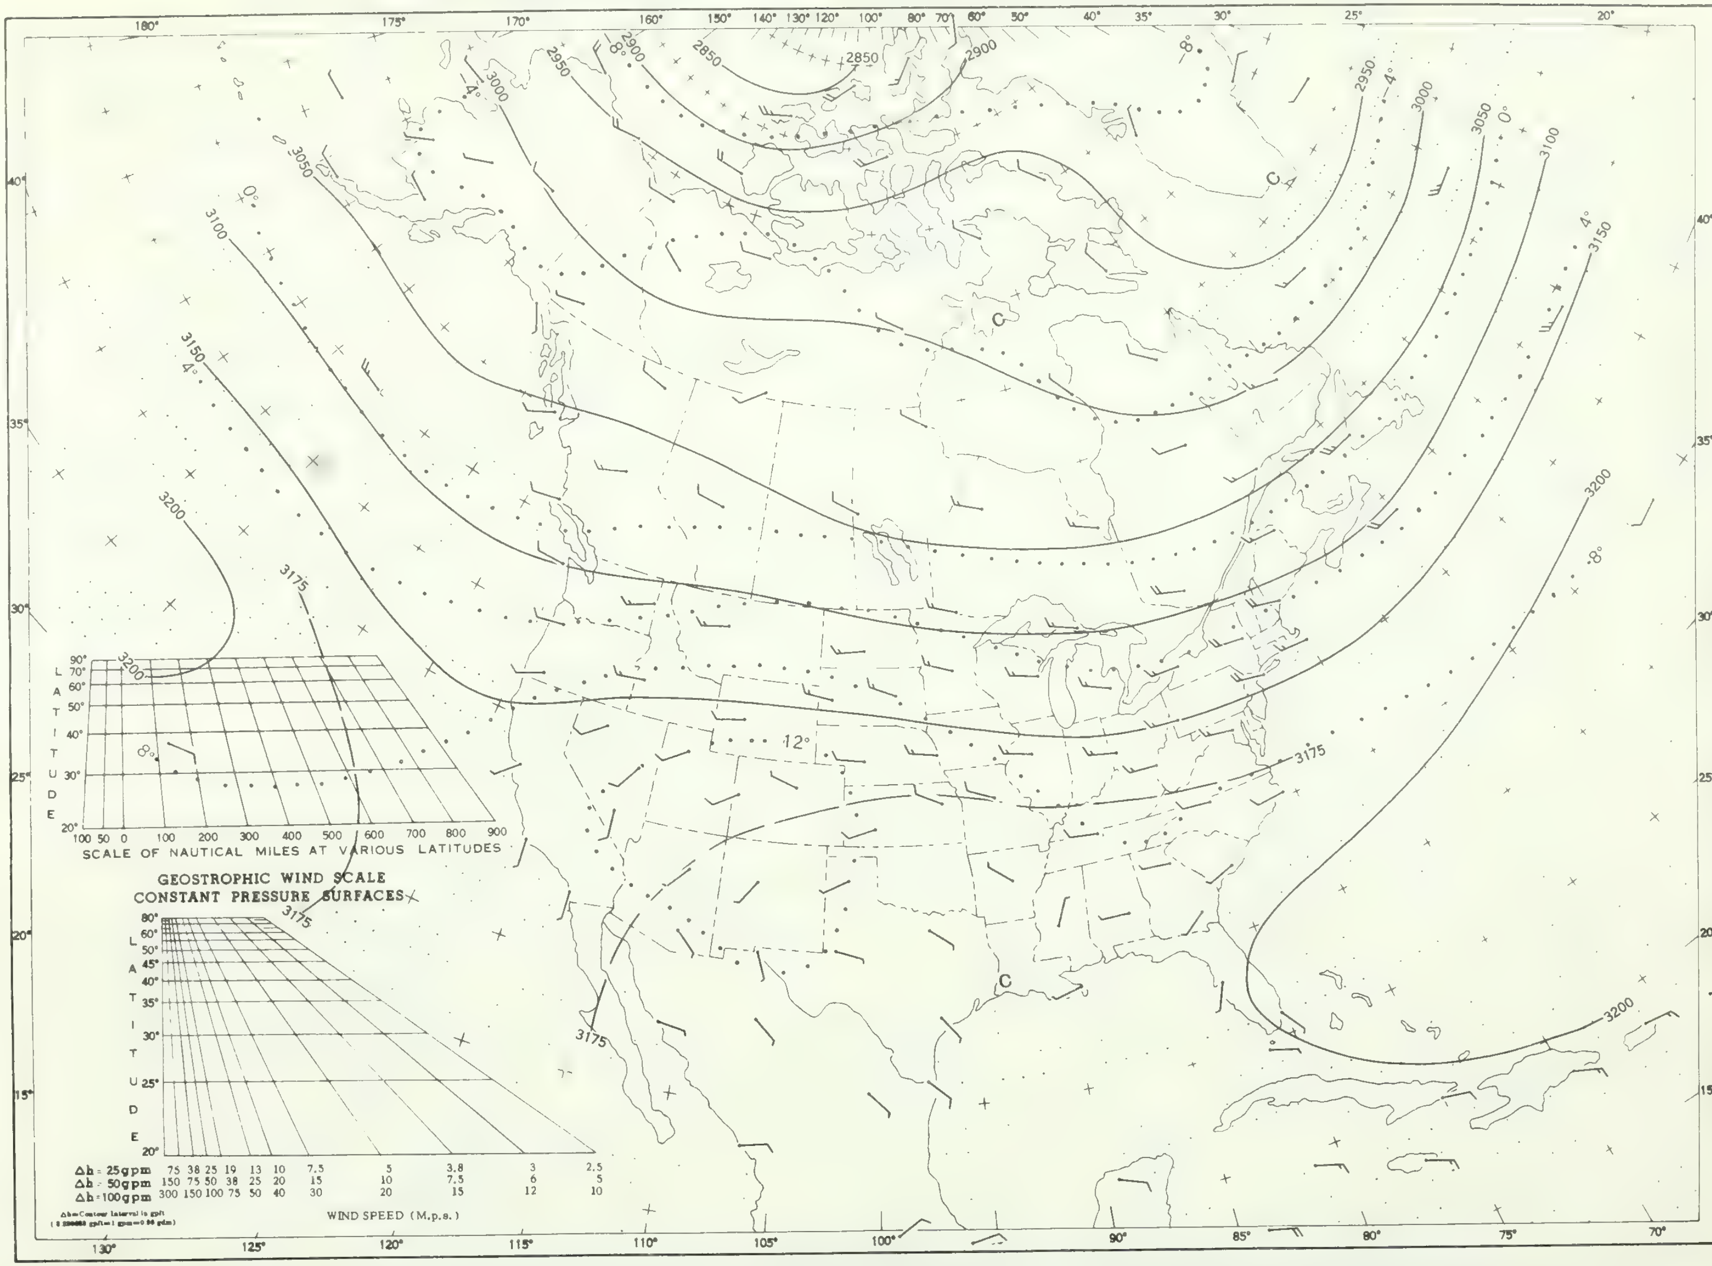
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb Surface, 1200 GMT, July 1969. Average Height and Temperature, and Resultant Winds.



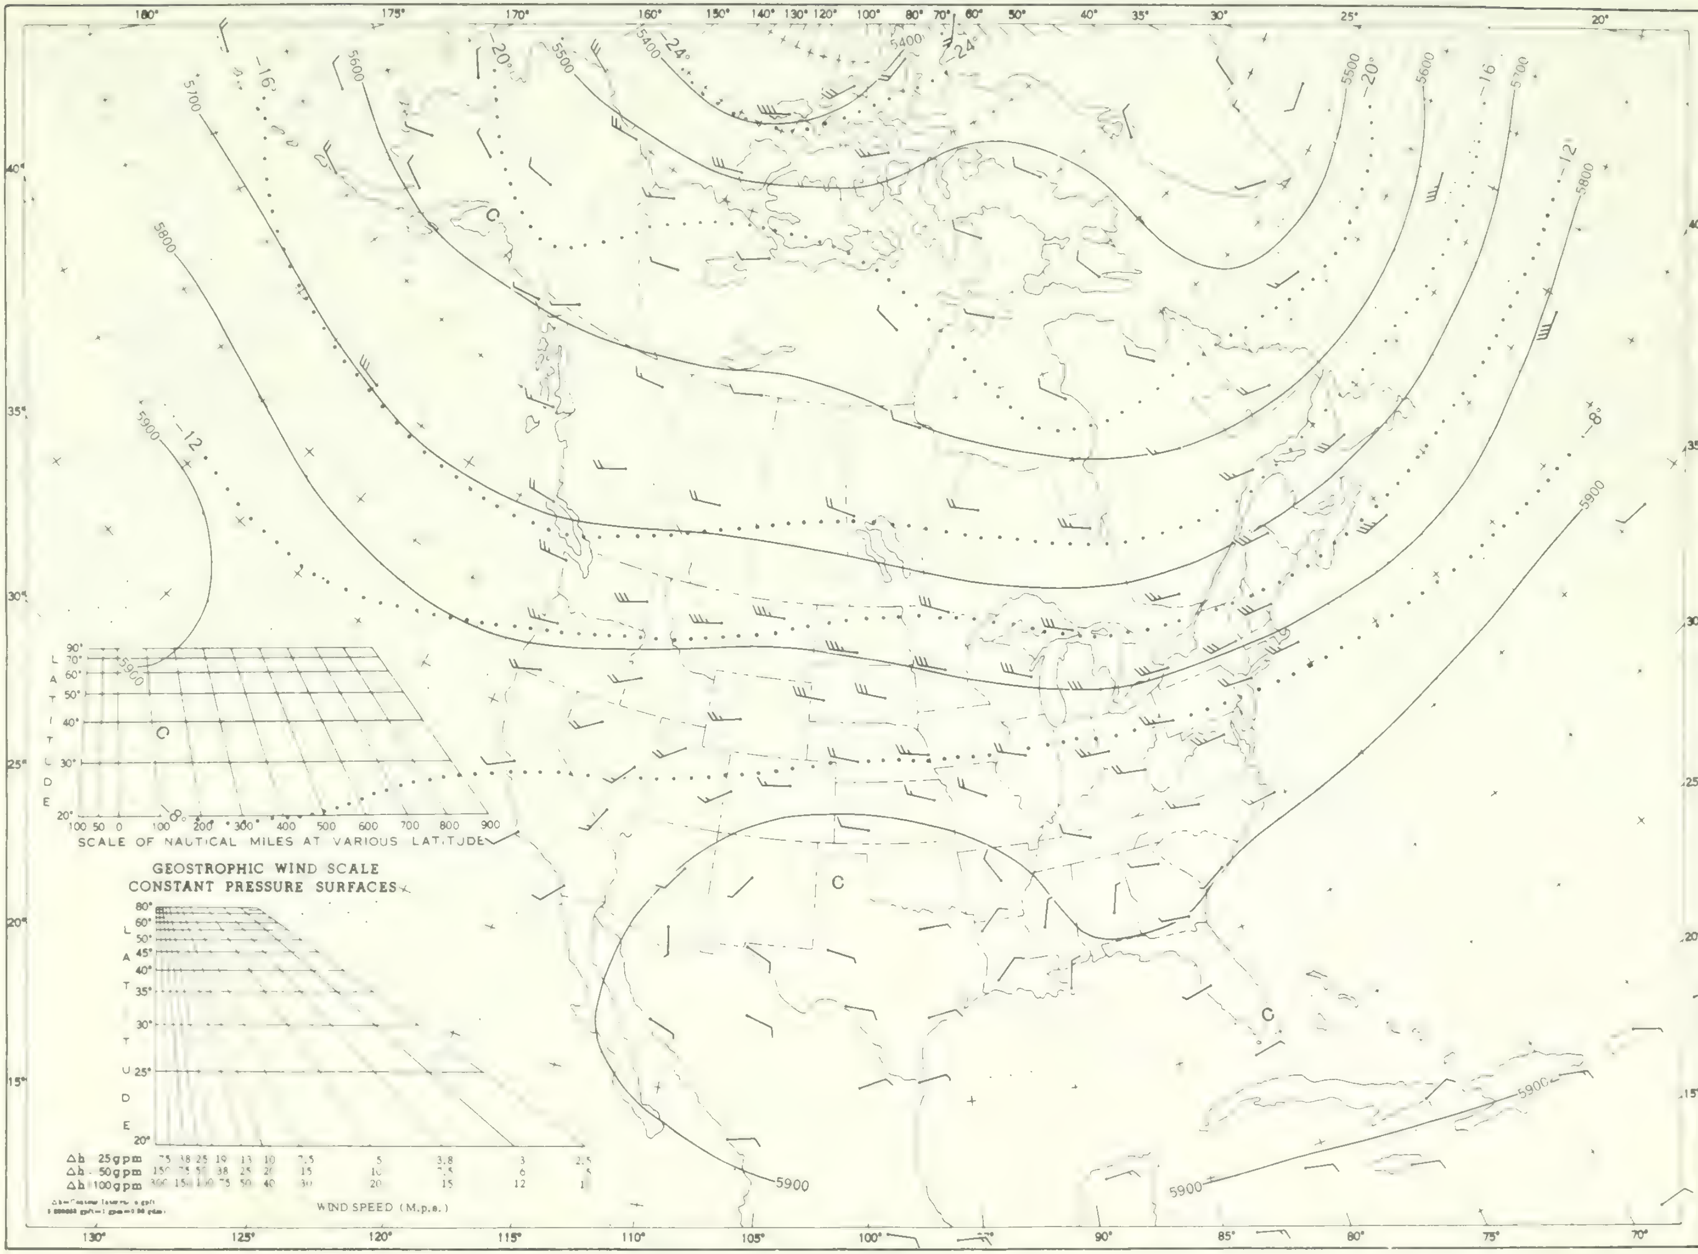
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb Surface, 1200 GMT, July 1969. Average Height and Temperature, and Resultant Winds.



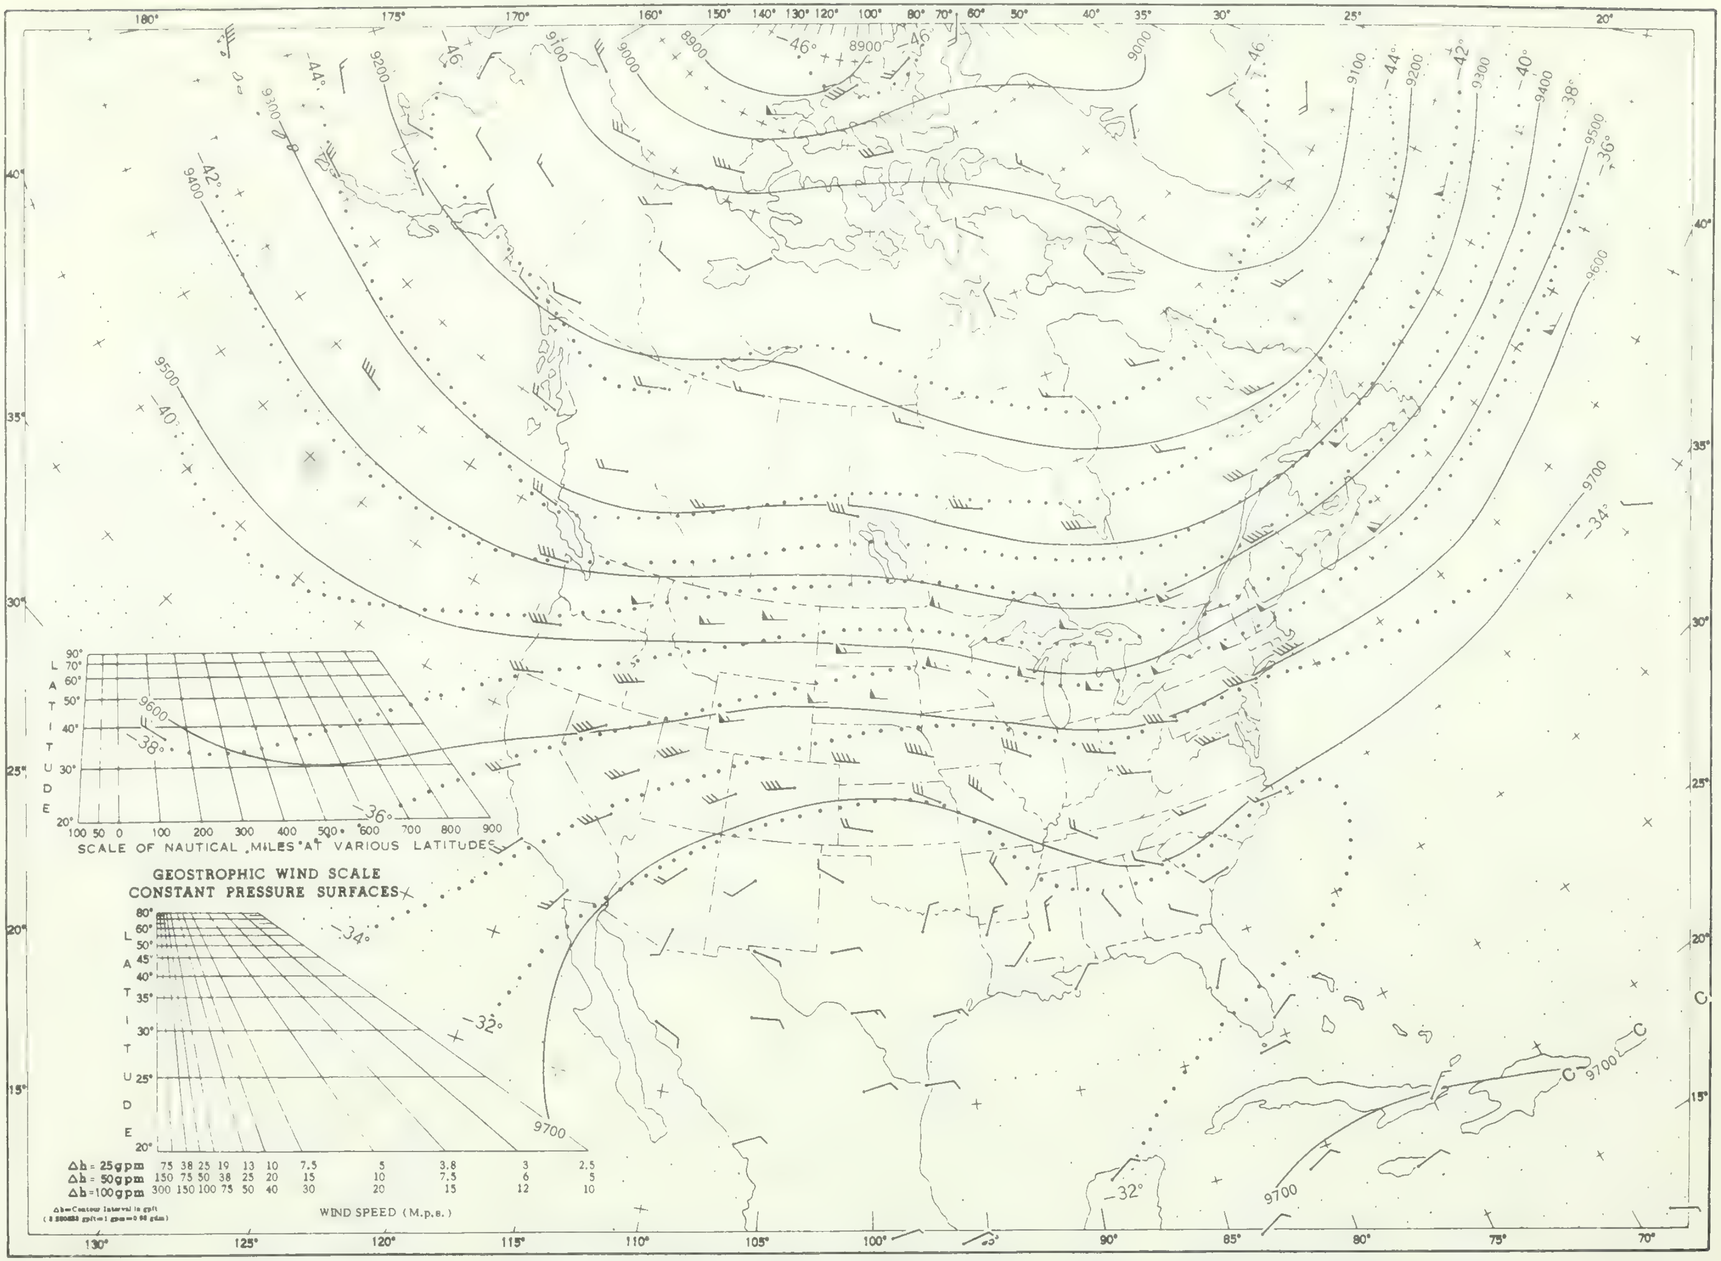
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII. 500-mb. Surface, 1200 GMT, July 1969 Average Height and Temperature, and Resultant Winds



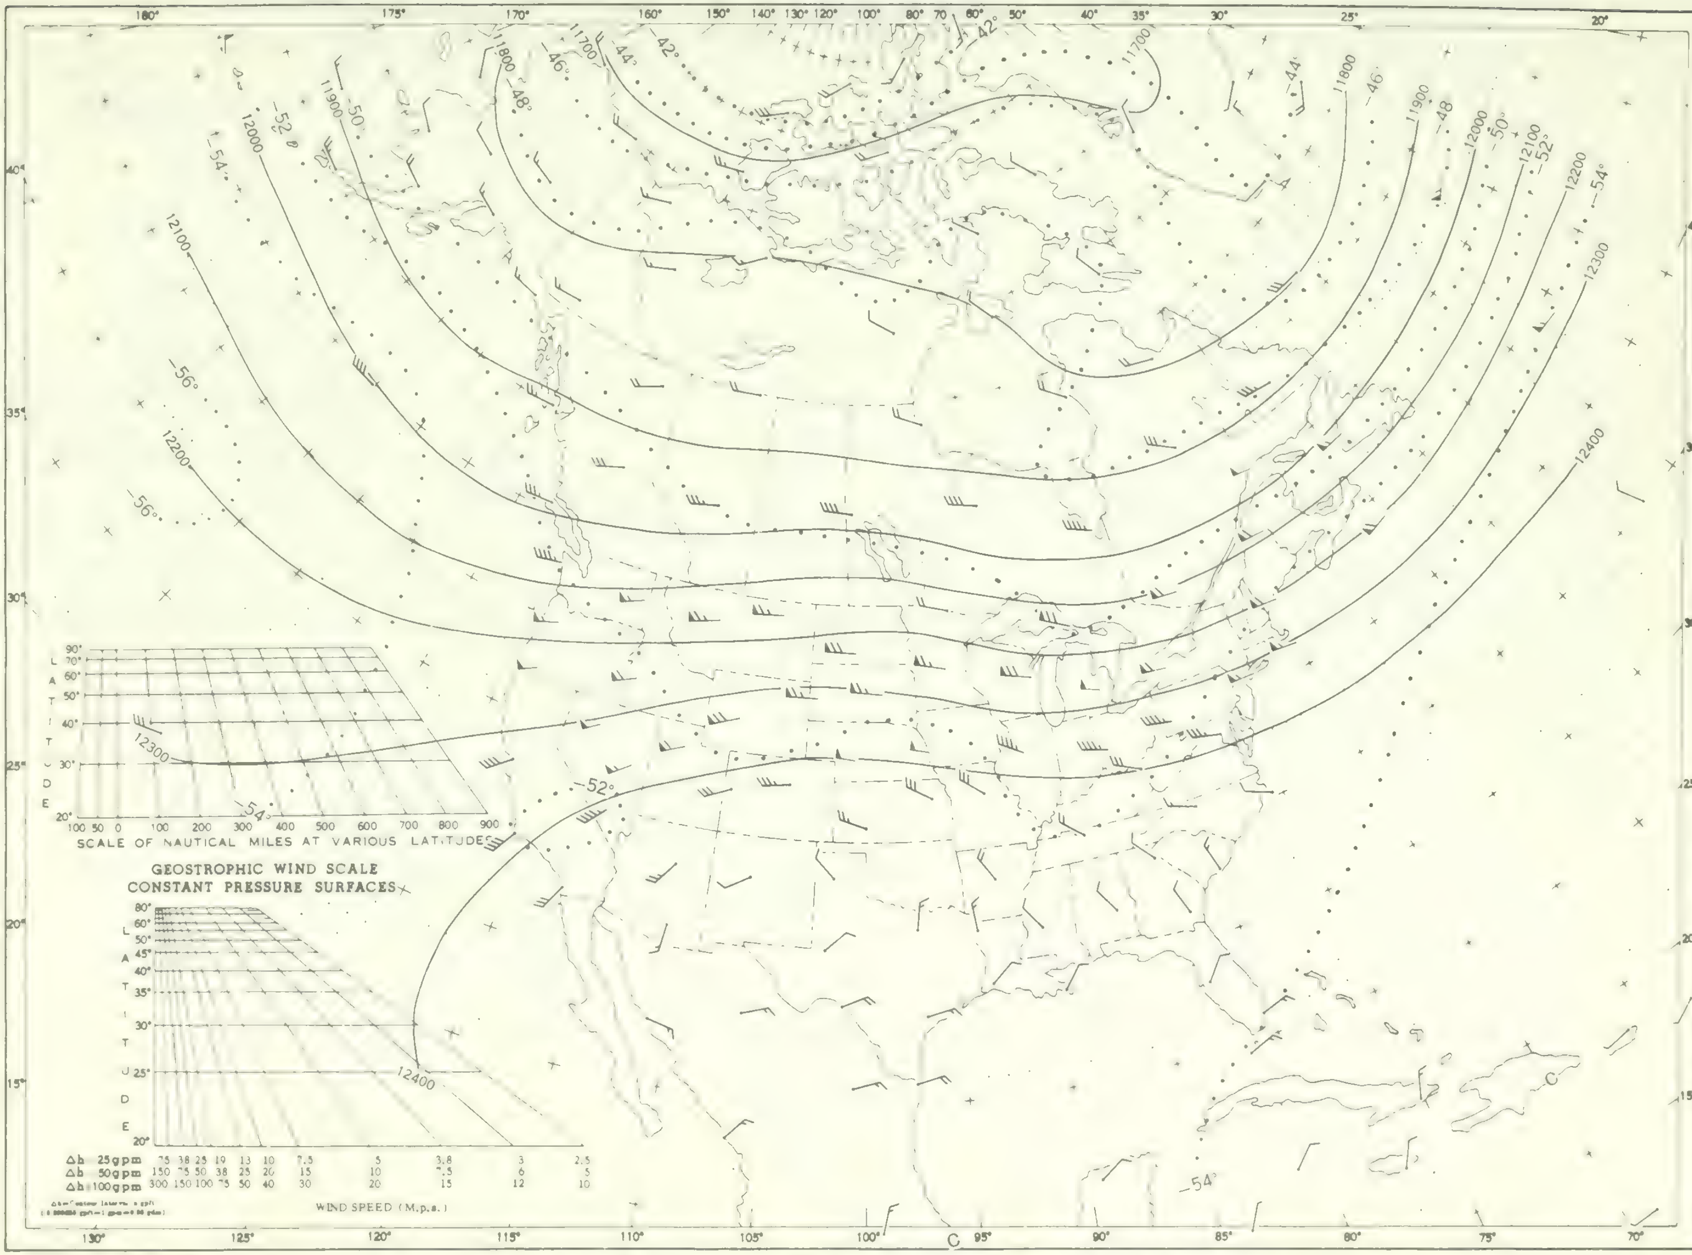
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV. 300-mb. Surface, 1200 GMT, July 1969. Average Height and Temperature, and Resultant Winds



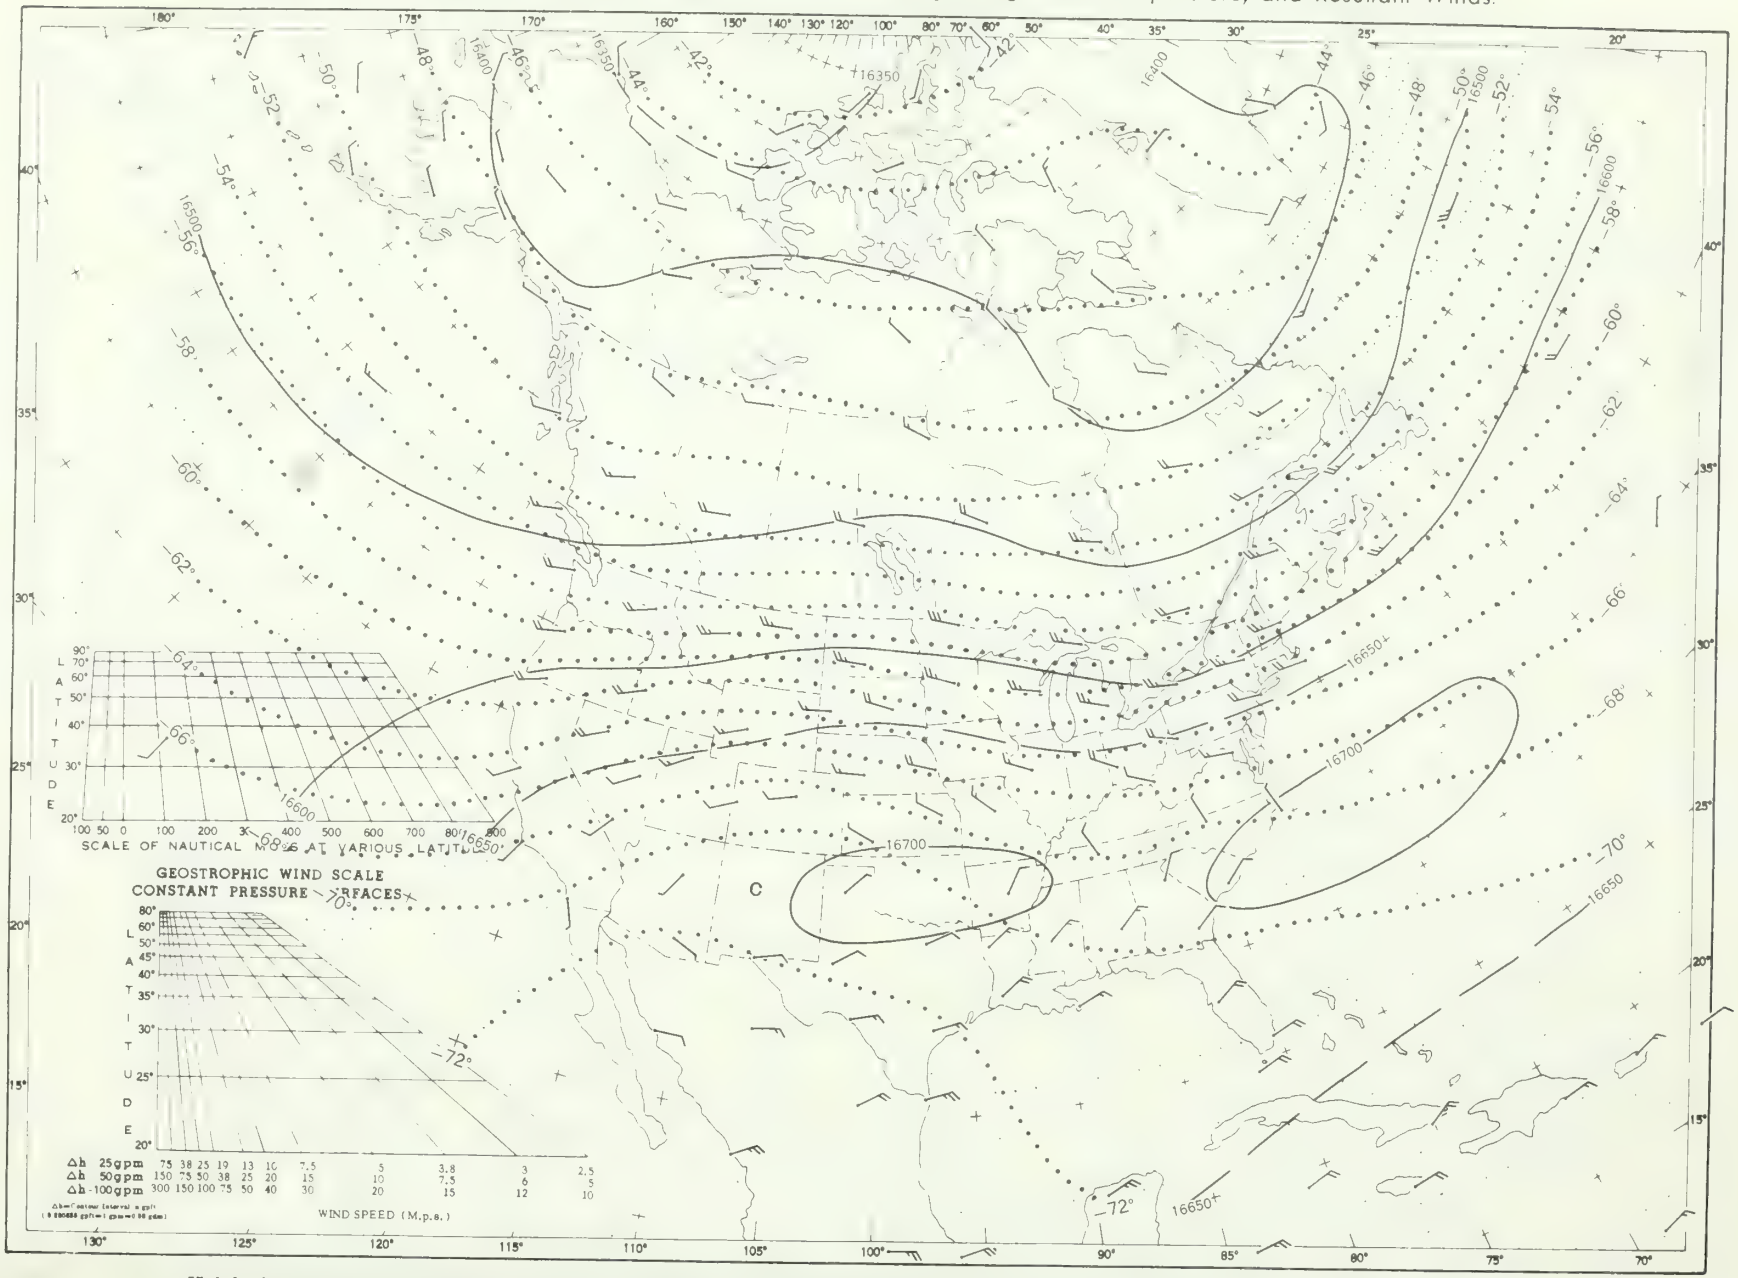
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV 200-mb Surface, 1200 GMT, July 1969 Average Height and Temperature, and Resultant Winds.



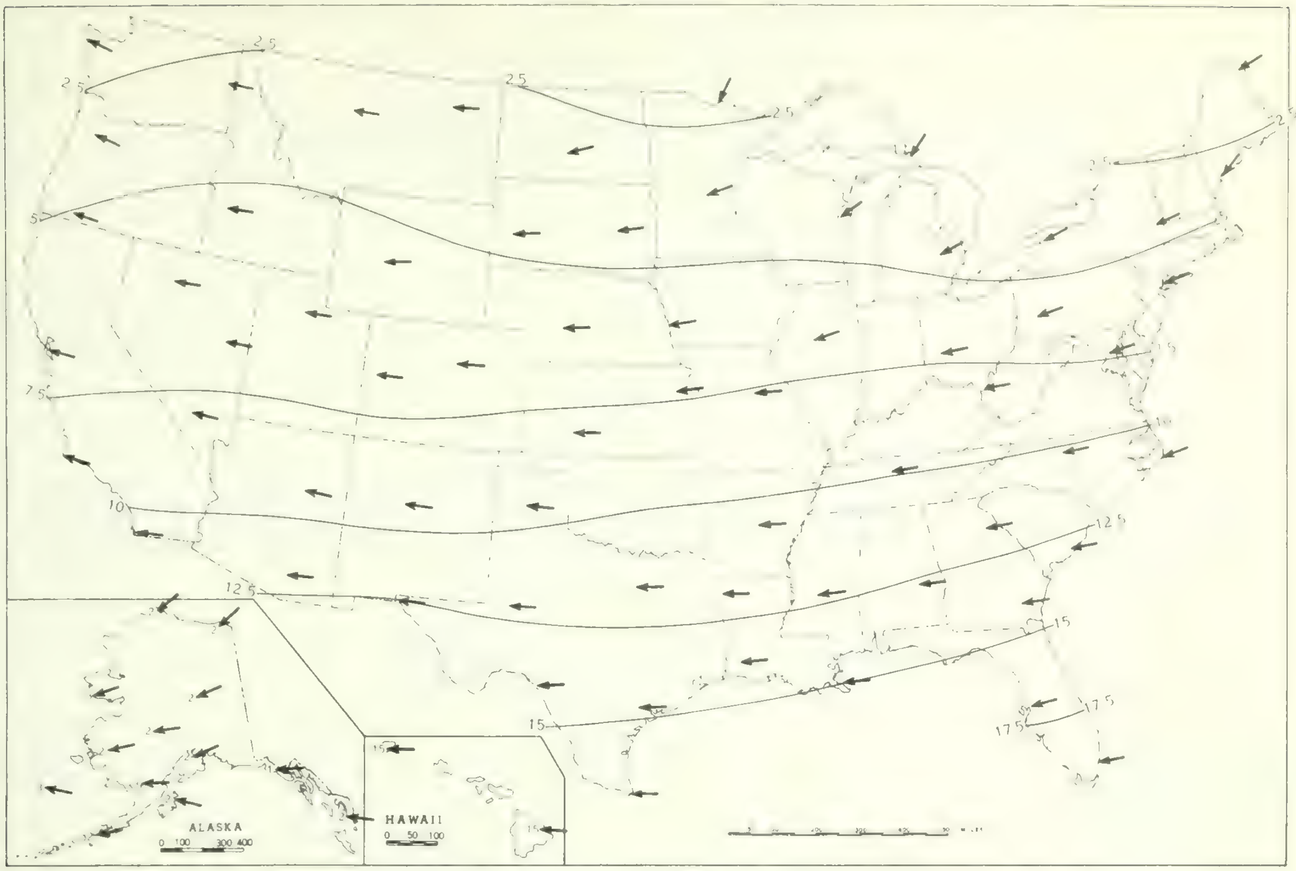
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI. 100-mb. Surface, 1200 GMT, July 1969 Average Height and Temperature, and Resultant Winds.

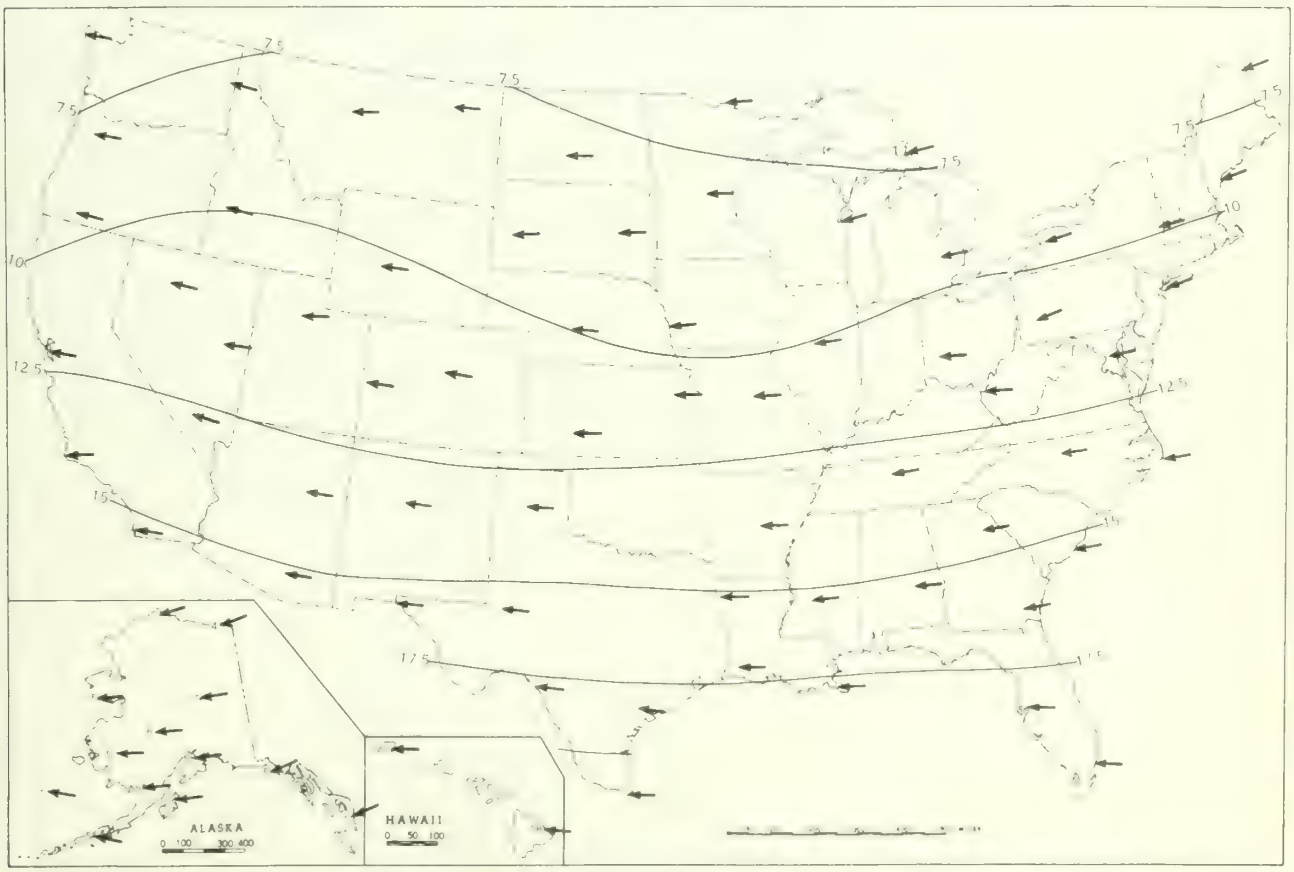


Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 GMT, July 1969. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, July 1969. Resultant Winds.



Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

AUGUST 1969
Volume 20 No. 8

Asheville 1970

C O N T E N T S

NOTE: Delayed data and corrections will be carried in the June and December issues of this publication. An explanatory page "Description of Charts" will be carried in the January and July issues.

SUBSCRIPTION PRICE: Monthly 20 cents and annual 40 cents per copy; yearly subscription, including monthly and annual issues, $2.50 domestic, $3.50 foreign. Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to "Superintendent of Documents, Government Printing Office, Washington, D.C. 20402"

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 20 No. 8 AUGUST 1969

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Hot weather with little rain persisted in much of the West and some portions of the northern Great Plains.
2. One of the most devasting hurricanes of record hit Mississippi on the 17th.

TEMPERATURE.--Temperatures in the Far Northwest averaged near or slightly below normal in August. That area was cooler than normal throughout the month except for a short warm spell a few days before and after the end of the 3d week of August. Sweltering heat persisted in the southwestern deserts, with temperatures going above 100° on many days and from 110° to 117° on a few days. These areas averaged 4° to 5° warmer than in most years. Under sunny skies afternoon temperatures in Texas ranged from the upper 90's to 110° until the last week when maximums dropped to the upper 80's and low 90's. August temperatures in Texas averaged slightly above normal. The month averaged warmer than normal over the northern tier of States from Montana to New England. Afternoon temperatures soared to 100° in parts of Montana on 2 or 3 days in the 3d week of August but frost occurred in the western valleys of the State in the final week.

Temperatures averaged below normal from Kansas and Oklahoma to Pennsylvania, in the middle Atlantic coastal area, and the Deep South. Clouds and rain kept temperatures down over much of this area in the first 3 weeks. Cool, dry continental air lay over the Deep South in the last part of August. The final week was especially cool in South Carolina where the temperatures at some places averaged up to 6° below normal. Temperatures in the Northeast averaged near or above normal except below normal in the 3d week when cool dry continental air dropped minimums in the 40's and 50's and afternoon maximums in the 70's and 80's from Pennsylvania to New England. Monthly average temperatures in New York, New Jersey, and New England were 1° to 4° above normal.

Numerous temperature records were set in August 1969. El Paso, Texas, registered 100° or higher on 17 days. On the 11th, Waco, Texas, registered 112°, the hottest August temperature in 82 years. The temperature at Phoenix, Ariz., averaged 94.4°, the hottest in the 20th Century. Numerous other places, mostly in the Southwest, suffered the hottest August of record.

PRECIPITATION.--Heavy thundershowers occurred along the eastern seaboard and parts of the Deep South in the first few days of August. Storm totals exceeding 4 inches in some localities caused considerable flash flooding and erosion. While much of the South became too wet, local areas, missed by the rains, needed more moisture. About the end of the first week of August, a cold front edged into the northern Great Plains, setting off thunderstorms and killer tornadoes. Several tornadoes occurred in North Dakota on the late afternoon of the 5th and the forenoon of the 6th and a dozen touched down in Minnesota on the 6th. The worst of the tornadoes killed 12 persons, injured 70, and caused over $2 million damage to property in Cass and Aitken Counties, Minn. Ten tornadoes struck St. Louis County, Minn., causing additional losses of lives and property. Tornadoes struck Iowa on the 8th and Indiana and Ohio on the 9th. The most damaging of these killed 4 persons, injured 247, and caused extensive property damage in the Cincinnati, Ohio, area. The twister demolished 27 residences, caused heavy damage to 200 and minor damage to 2,300 others, besides damaging or destroying 25 businesses and 100 mobile homes.

Hurricane Camille slammed into the Mississippi coast on the 17th with winds estimated at 200 m.p.h. and tides 10 to 20 feet above mean sea level. The death toll in Mississippi and southwestern Louisiana stands at 137. Catastropic flooding followed 5- to 30-inch rains in southwestern Virginia as the storm, no longer a hurricane, moved eastward to the Atlantic. The torrential rains caused washouts, extensive flooding, and dreadful landslides which crushed buildings, killing the occupants and, in some cases, burying them in mud and debris. The death toll in Virginia stands at 153; 2 were killed in West Virginia.

Moderate to heavy showers fell in the Great Plains near the end of the third week of August. On the evening of the 23d, heavy showers caused minor local flooding in Colorado and Oklahoma. Showers were both frequent and generous in Texas in the last half of the month. Heavy showers at the end of August caused local flooding along the Little Blue River in south-central Nebraska and in north-central Kansas.

No rain or only light sprinkles fell in Oregon and northern and central California. Monthly totals less than an inch were common over most of the west and the northern portions of the Rocky Mountains and Great Plains.

Some new minimum precipitation records were established in August 1969. Among these were 0.08 inch at Dubuque, Iowa, 0.11 inch at Muskegon, Mich., and 0.05 inch at Glasgow, Mont., for the driest August of record.

OBSERVED EXTREMES OF TEMPERATURE AND PRECIPITATION -- BY STATES

AUGUST 1969

STATE	Temperature						Precipitation

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70°F. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

HURRICANE CAMILLE, August 5–22

Richard M. DeAngelis
Environmental Data Service, ESSA
and
Elmer R. Nelson
Office of Hydrology, Weather Bureau, ESSA

DEVELOPMENT

Camille was spawned by a tropical wave that had moved off the African coast on the 5th of August. This inverted "V" cloud pattern travelled westward and was recognized as a tropical disturbance on the 9th, about 480 mi. east of the northern Leeward Islands. The following day the disturbance, still showing no circulation, moved through the Leewards causing rains throughout the Islands. Then each succeeding day, satellite pictures revealed increased curvature and banding. On the 14th reconnaissance aircraft flew into the disturbance, which they found south of Cuba. The penetration disclosed a 999-mb. pressure center and 55-m.p.h. surface winds -- tropical storm Camille was christened.

INTENSIFICATION

The storm moved northwestward at 9 m.p.h.; pressure fell to 991 mb. late on the 14th, and to 964 mb. with 115-m.p.h. winds the following day. At this time Camille was a full-blown hurricane located 60 mi. southeast of Cape San Antonio, Cuba. Havana's weather radar tracked the hurricane across the western tip of Cuba on the evening of the 15th. Camille generated 92-m.p.h. winds at Guane, and spread 10-in. rains over the western sections of the Island. Three persons were reported killed.

Once into the Gulf of Mexico, the small, powerful hurricane intensified rapidly; by the early afternoon of the 16th (fig. 1), central pressure had dropped to 908 mb. The severe storm plodded north-northwestward at 14 m.p.h. A hurricane watch had been put in effect from Biloxi, Miss., to St. Marks, Fla. By late afternoon an Air Force reconnaissance team measured a 905-mb. pressure and recorded flight level (700 mb.) winds of 160 m.p.h.

Early on the 17th, with Camille 250 mi. south of Mobile and hurricane warnings extending westward to New Orleans, Mississippi coastal residents were boarding up homes and businesses and heading inland. As the day wore on inland moving traffic increased as did the hurricane threat to low-lying areas. Radio and television stations carried ESSA warnings every few minutes, while Police and Civil Defense officials went into isolated areas to urge people to evacuate.

One last reconnaissance flight was made early Sunday afternoon (17th), and Air Force pilot Marvin A. Little and his crew found a central pressure of 901 mb. (26.61 in.) and maximum surface winds at more than 200 m.p.h. (175 kt.) near the center. Due to engine trouble this was the last penetration made. Hurricane force winds extended out to 60 mi.; Camille was a small but extremely intense hurricane located less than 100 mi. from the mouth of the Mississippi River. The storm was at its peak and was under surveillance of the New Orleans radar.

As Camille brushed southeastern Louisiana easterly winds ahead of the center and northerly winds to its west pushed a massive storm surge through the marshes of this area. Because of the shape of bays and inlets, surge heights varied at different locations; water levels reached 9 ft. above m.s.l. near the mouth of the Mississippi, at Garden Island. In several places from the Empire Canal southward to Buras, Boothville, and Venice the surge poured over both the east and west bank Mississippi River levees and was trapped by the back levee, leaving the built-up areas between the levees severely flooded.

LANDFALL

The center of Camille made landfall on the now nearly-deserted Mississippi coast at about 10:30 p.m. c.s.t. on the 17th; she passed over Clermont Harbor, Waveland, and Bay St. Louis. There were no records of winds near the center and estimates ranged up to 200 m.p.h. The storm surge reached a devastating 24.2 ft. above m.s.l. at Pass Christian and was near 10 ft. above m.s.l. as far east as the Mississippi-Alabama border. At the west end of the Bay St. Louis Bridge there was a pressure report of 26.85 in. (909.3 mb.).

Camille weakened as she moved northward through Mississippi, passing close to Columbia, Prentis, Jackson, Canton, and Greenwood. Jackson's winds gusted to 67 m.p.h. as the storm center passed 10 mi. to the east. The radar at Jackson, which had picked up Camille's eye in the Gulf, followed the identifiable circulation to southern Quitman County. The storm was only identifiable as a depression when it reached the northern Mississippi border.

OVERLAND

The depression stages of Camille were tracked northeastward through western Tennessee, east-northeastward through central Kentucky, and eastward through extreme southern West Virginia and southern Virginia. Late on the 19th, a combination of factors interacted to produce several areas of concentrated, torrential rainfall that caused devastating flash floods and landslides along the eastern slopes of the Blue Ridge Mountains and record flooding along the James River system

The remnants of Camille's dying circulation moved into an area already occupied by a large, moist maritime-tropical air mass, with some existing rain areas. To the northwest of the area of maximum rainfall a narrow valley surrounded by steep ridges suggested that orographic effects on the cyclonic flow aided in producing the heavy precipitation. Thunderstorm activity ahead of a slowly approaching cold front may also have accentuated the heavy rain. In combination these meteorological factors (and perhaps others not yet ascertained) produced torrential rains which rank with other record rainfalls throughout the world. Several amounts of more than 25 in. were found on post examination, and amounts in excess of 4 in. fell over an area 30-40 mi. wide and 120 mi. long -- most of it occurring in a period of 8 hr.

Camille regained tropical storm intensity when she moved into the North Atlantic. However, on the 22d, she was absorbed by a cold front about 175 mi. southeast of Cape Race, Newfoundland.

WINDS

Accurate wind measurements are almost impossible to obtain in a hurricane of Camille's intensity. Based on reconnaissance flight level winds and measured surface pressure, maximum surface winds were calculated at 175 kt. (201.5 m.p.h.), close to the center, early on the afternoon of the 17th. This calculation represents the maximum winds ever observed in a hurricane and based on something other than pure estimation. The Labor Day Hurricane of 1935 may have had more severe winds but there is just no way of telling.

Figure 1. ESSA 9 satellite spots Camille on the afternoon of the 16th, near the time the 905-mb pressure was recorded.

The highest actual measurement on a wind instrument was found on an Easterline Angus wind speed recorder which had been left running on a Transworld Drilling Co. rig located east of Boothville (Maine Pass Block 29) (fig. 2). The recorder had been switched to double scale before evacuation and recorded an extreme gust of 172 m.p.h. before the paper jammed and the trace was lost. An Air National Guard Weather Flight stationed at Gulfport Municipal Airport, estimated sustained winds in excess of 100 m.p.h. and gusts of 150-175 m.p.h. Other less reliable reports from the Gulfport-Bay St. Louis area indicated winds of 150-200 m.p.h. At Boothville, La., 107-m.p.h. gusts were recorded before a power failure; at Pilottown, La., the SS CRISTOBAL estimated winds at 160 m.p.h.

Winds at Biloxi (Keesler AFB) were measured at 81 m.p.h. with gusts to 129 m.p.h. late on the 17th. At Ingalls Shipyard in Pascagoula the highest sustained wind reached 81 m.p.h. while a local radio station reported 104-m.p.h. winds before power failure.

West of the storm center hurricane force winds reached only the eastern edge of New Orleans; brief gusts of 60-85 m.p.h. extended over most of the city. Eastern sections of St. Tammany and Washington Parishes were swept by intense winds estimated up to 160 m.p.h. in gusts at Slidell and up to 130 m.p.h. in gusts at Bogalusa and Angie.

Hurricane force winds were confined close to the storm's center as it moved inland. These winds extended from east of New Orleans to Pascagoula, while gusts of hurricane force winds extended along the coast from New Orleans to just west of Mobile Bay and inland to just south of Jackson.

PRESSURE

Camille's lowest pressure of 901 mb. (26.61 in.) was second only to that of the Labor Day Hurricane of 1935, in which a 26.35-in. (892 mb.) pressure was recorded in the Florida Keys. This stands as the lowest pressure in the North Atlantic; the world record low pressure was recorded in typhoon Ida on September 24, 1958 -- 877 mb. (25.90 in.).

The 908-mb. pressure recorded on the afternoon of August 16 marked the lowest ever recorded by reconnaissance aircraft in the North Atlantic; however, this was soon broken by the 905-mb. reading later in the day and the historic 901-mb. pressure the following day.

The lowest land pressure was observed by Mr. Charles A. Breath, Jr. of Bay St. Louis, in his home a few blocks from the west end of Bay St. Louis Bridge. He made the reading of 26.85 in. on his aneroid barometer as the eastern edge of Camille's eye passed overhead. His barometer was later checked and found to be accurate by the New Orleans Weather Bureau Office. Other low pressures included a 27.80-in. reading at Garden Island, La., and a 27.90 in. at St. Stanislaus School in Bay St. Louis.

STORM SURGE

The storm surge generated by Camille flooded coastal areas from lower Plaquemines Parish in Louisiana to Perido Pass, Ala. Flooding was most severe in the Pass Christian - Long Beach, Miss., area where tides up to 24.2 ft. above m.s.l. were measured. In the St. Louis Bay maximum tides ran 18 ft. above m.s.l., while in the Back Bay of Biloxi they were about 15 ft. above m.s.l.

A chart of the storm surge measurements and flooded areas is shown in figure 3. This chart is based on a series of 15 maps of scale 1 in. to 2,000 ft., extending from near the mouth of the Pearl River to Bayou La Batre, Ala., and indicates in detail the areas flooded and surge measurements. These maps are available from the U. S. Geological Survey, Washington, D. C. 20242. Additional information for this summary was obtained from the nearly completed preliminary data of the Mobile District Corps of Engineers. Their final report is due around May 1, 1970.

Maximum tides of 10 ft. or more above m.s.l. extended from the Pearlington area to near the Mississippi - Alabama line. Maximum tides 15 ft. or more above m.s.l. extended from Clermont Harbor to Ocean Springs. Maximum tides of 20 ft. or more above m.s.l. were concentrated in an area from Bay St. Louis eastward to Edgewater Park. The highest measured surge of 24.2 ft. above m.s.l. was measured within the city limits of Pass Christian; other measurements of 22.6 ft. and 22.5 ft. were also found at Pass Christian. Tides within the preceding ranges were lower in some areas. Flooding was also prevalent along rivers and bayous in Mississippi. Tides ran 13-17 ft. above m.s.l. from the Jordan River (Waveland) to Old Fort Bayou (Ocean Springs).

Offshore surges were put at 15-16 ft. above m.s.l. based on the flood marks measured at Ship and Cat Islands. The Coast Guard reported every buoy between New Orleans and Mobile was off station and that almost all of the navigational aids had been lost. In the Mobile Bay area tides ran about 7 ft. above m.s.l.

The Louisiana storm surge that swept from Empire southward, flooded Boothville with 15 ft. (above m.s.l.) of water (fig. 4). Water levels reached 9 ft. near the mouth of the Mississippi, at Garden Island. The tidal surge also flooded some parts of lower St. Bernard Parish and eastern sections of Orleans Parish. Tide heights reached 7.97 ft. above m.s.l. at Alluvial City, 8.73 ft. at Chef Menteur Pass, 11.06 ft. at Shell Beach, and 9.00 ft. at the Rigolets. Tides on Lake Pontchartrain reached 4.0 ft. above m.s.l. at Manderville, 4.6 ft. at Frenier, 5.2 ft. at Slidell, and 5.5 ft. at Madisonville.

DEATHS AND DAMAGES

Hurricane Camille ranks high as one of the most destructive killer storms ever to hit the U. S. Total damage has been estimated at $1.42 billion with 258 deaths and 68 additional persons missing -- this includes the Gulf Coast and the Virginias. In round figures the damage equals the destruction caused by hurricane Betsy, in a much more concentrated area, in September of 1965. Betsy and Camille stand together as the two most destructive storms to ever ravage the U. S.

While most of Betsy's damage was incurred by Louisiana, Camille spent most of her wrath in Mississippi; the total figure there is estimated at $950 million; Louisiana suffered $350 million mostly in lower Plaquemines Parish. Table 1 gives a complete breakdown of damages and deaths.

The total U. S. deaths figure was 258 with three persons reported dead in Cuba. The U. S. figure is the highest in a hurricane since 390 persons died during hurricane Audrey, which moved over western Louisiana in June 1957; most of these deaths, like those in Camille, were drownings.

Camille ripped a swath of destruction along the entire length of the Mississippi coast up to three or four blocks inland. She also destroyed some inland areas such as residential sections of West Gulfport and the Biloxi suburb of D'Iberville. In low areas

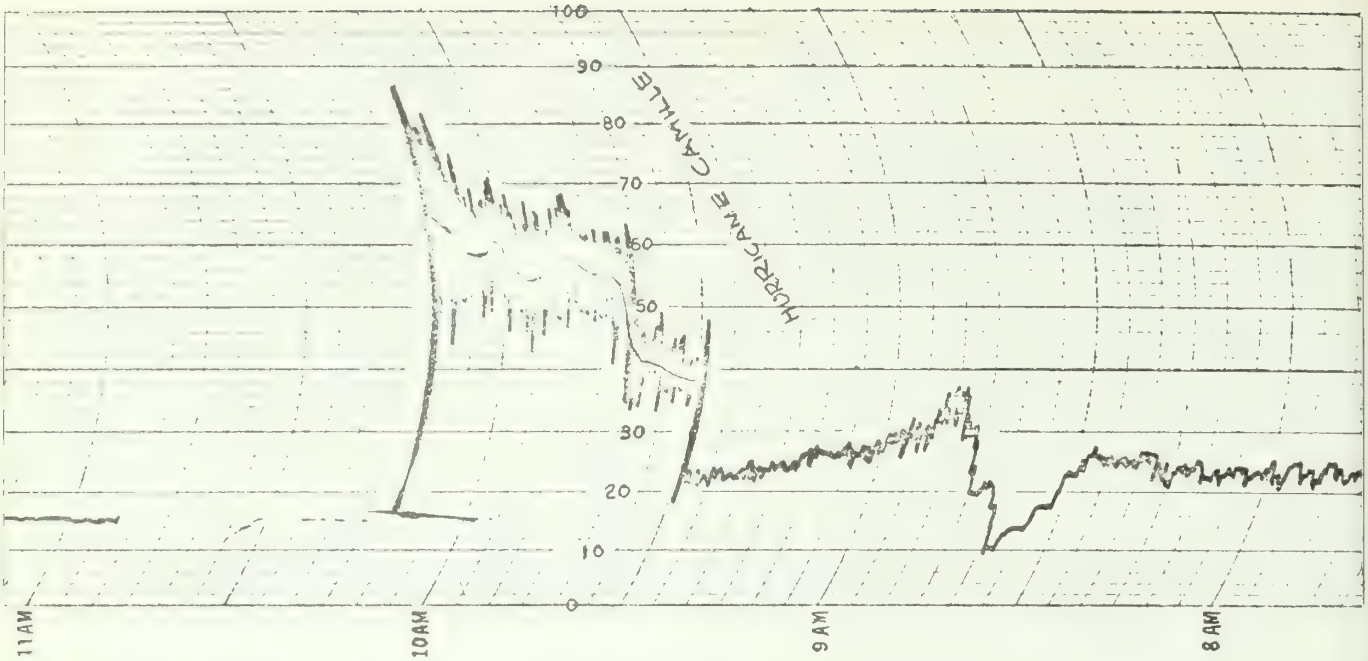

Figure 2. This wind chart from Transworld Drilling Company's RIG 50 was set on double scale, and the recorder was left running after the crew evacuated.

Figure 4. The flooded Weather Bureau Observatory at Boothville, La., shortly after Camille devastated the area. Notice the telephone pole at the lower left.

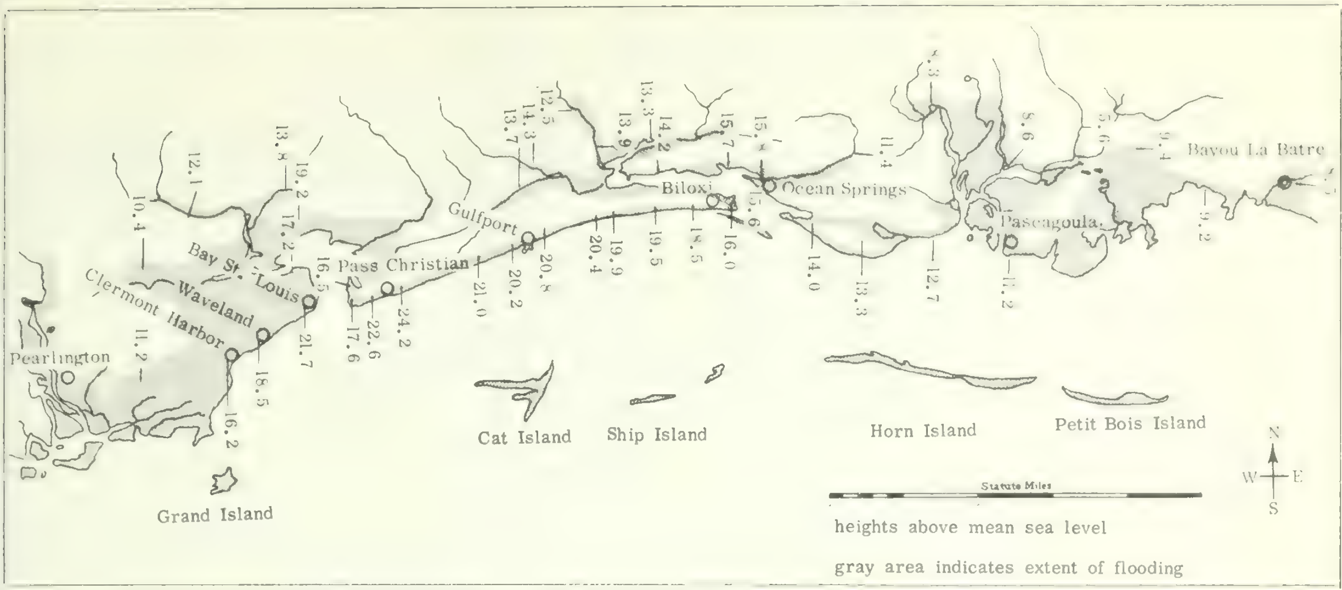

Figure 3. These are the results of the storm surge generated by hurricane Camille on the Gulf Coast from the Pearl River to Bayou La Batre; based on charts prepared by the U. S. Geological Survey.

The data below was furnished by the Red Cross, except for the dollar damage figures, which are preliminary estimates developed by OEP field offices based on information from Federal, State and local sources.

the rows of houses stopped a block or two from the beach and beyond a row of debris were bare foundations along the beach front. From Pascagoula to Pass Christian, and to a lesser degree farther east and west, piles of lumber, building materials and trees were thrown together by the surge. In some cases piles of debris extended for more than a block square. Highway 90, the main coastal thoroughfare, was covered with sand in many sections and completely washed away in other sections. About one-third of the Bay St. Louis Bridge and one-half of the Biloxi-Ocean Springs Bridge were damaged when tides lifted the spans off their supports. The Army Corps of Engineers indicated that to make some 530 mi. of roads passable, about 100,000 tons of debris had to be cleared away. Mr. M. James Stevens, Vice-President of the Mississippi Restaurant Association, reported that the Coast's resort industry suffered the worst disaster of any similar recreation area in the world. Along U. S. 90 in the Biloxi area some 60 resort properties suffered damage with about one-half of them destroyed. Buildings on high knolls of about 20 ft. or more were able to weather the high winds and survive the storm surge. Many buildings at the 10-ft. level were crushed.

At Clermont Harbor the destruction was total and eastward to Bay St. Louis many hundreds of beach homes were destroyed. Henderson Point in the Pass Christian area was completely destroyed except for an old building that was formerly a maritime academy. In the Gulfport harbor damage was severe. Three large cargo ships, the ALAMO VICTORY, the HULDA, and the SILVER HAWK were badly damaged and washed high aground at the north end of the harbor (fig. 4). At the banana wharf all the sheet metal was stripped from the structures, but most of the framework was intact. On the west side of the harbor most of the damage was to the lower walls of the buildings where the battering-ram effect of floating cargo carried the sides away. A large diesel fuel barge was lifted out of the harbor, carried ashore, and deposited on the medial strip of U. S. 90. Farther up the beach was a large oil storage tank that had floated several miles from its original position.

The beautiful, modern marina fronting the Broadwater Beach Hotel at Biloxi appeared to be intact, but at close inspection the molded concrete covers over the boat slips had corners and pieces broken off by floating debris in the high water. Buildings along the waterfront were demolished and most of the boats were either sunk or had been washed away.

At Pascagoula's Ingalls Shipyard the large cargo ship, MORMACSUN, under construction, broke its moorings and was carried by a 12-ft. rise of water onto high ground.

In Hancock County most residents live in low-lying areas. In the hamlets of Lakeshore, Clermont Park, Pearlington, Ansley and the Cedar Point section of Bay St. Louis, destruction was almost complete. Storm surges of 15 ft. and higher and devastating winds turned beach houses into stacks of driftwood. At the Mississippi Test Facility, southeast of Picayune, some 1600 refugees took shelter Sunday night (17th). The high winds and water knocked down some overhead powerlines and flooded the underground lines. Emergency generators were put into use but operations at the facility were suspended until Tuesday.

In Pearl River County there was an estimated $35-40 million loss from damage. The county agent said that about 85 percent of the dairy barns in the county were either severely damaged or were a complete loss. About 35,000 - 40,000 acres of bearing tung trees were destroyed. There was an additional loss in timber and heavy damage was inflicted on the pecan crop. In Poplarville, the county seat, the mayor estimated that about 90 percent of the homes sustained damage in varying degrees.

There was electric power failure throughout 14 counties, from the coast to as far north as Simpson County. In some sections this loss lasted for several days. The South Mississippi Power Co. had to almost completely rebuild their distribution system, and their transmission network was badly damaged. Camille's effects were also devastating on telephone service. Of Mississippi's 765,000 telephones, approximately 15 percent were out of service. In the Gulf Coast area this figure jumped to 67 percent.

The U. S. Forest Service made an aerial survey over a 14 county area of southern Mississippi, an area of 3.8 million acres, which revealed that about 1.9 million acres of commercial forest land in 12 counties received varying degrees of damage. Observations from the air indicated that hardwood forests suffered somewhat heavier damage than pine forests. Some of the hardwood forests were completely defoliated by severe winds. The Forest Service estimates damage to Mississippi sawtimber at 1.8 billion board feet and to pulpwood at 1.4 million cords. Table 2 indicates tree damage in Mississippi.

Damage in Louisiana was confined mainly to southeastern sections with some damage in the eastern part of the state. The storm surge generated by Camille swept the area from Empire southward clean. Most structures in this area, including some that had survived hurricane Betsy, were completely demolished by the combination of wind and water. The tidal surge also flooded some parts of lower St. Bernard Parish and eastern sections of Orleans Parish. Camille's intense winds were unusually small in areal extent, particularly to the west of the center. Damage in these areas was generally minor. However, eastern sections of St. Tammany and Washington Parishes were swept by intense winds and heavy rainfall (4-6 in.) and this heavily forrested area received considerable damage. Extensive property damage resulted from trees falling on homes and businesses, utility lines and roads.

Agricultural and timber losses, including 8,000 head of cattle and 150,000 orange trees in Plaquemines Parish; oyster beds in Plaquemines and St. Bernard Parishes; tung oil trees and timber (mainly pine) in St. Tammany and Washington Parishes, have been estimated by the Louisiana Department of Agriculture at over $40 million.

RAINFALL

A serious drought had plagued Mississippi, Tennessee, and Kentucky for many weeks preceding hurricane Camille. Soil moisture was much below normal, pasture conditions were poor, and crops were suffering; Camille's rains relieved the drought in some areas and eased it in western Tennessee, where it had been severe. Rainfall amounts of 3-5 in. fell over western Tennessee and southern West Virginia. In some sections the rains were a few weeks too late to prevent serious loss of crops; some grains were badly damaged, and most farmers were feeding cattle their winter supply of hay. Table 3 shows heavy amounts and duration of rain in Mississippi, western Tennessee, Kentucky, West Virginia, and Virginia. A detailed breakdown of hourly and daily precipitation amounts at numerous stations may be found for every state, in the EDS publication Hourly Precipitation Data, Daily Totals, available at

the National Weather Records Center, Asheville, N. C.

As the weak and seemingly innocuous low pressure center associated with Camille crossed the Blue Ridge Mountains into southwestern Virginia, rainfall reached catastrophic proportions in that area. Results of a bucket survey conducted by the Weather Bureau (table 4) showed that 12-14 in. totals were common in Nelson County and the southern part of Albermarle County. The poststorm survey showed a 27-in total near Massies Mill and an unconfirmed report of 31 in. near Tye River, Va. Figure 7 shows the storm rainfall analysis as made by the Office of Hydrology's Hydrometeorological Branch.

The 27-in. rainfall total in Nelson County, Va., which fell within about 8 hr., represents one of the all-time meteorological anomalies in the United States. A study made by the Weather Bureau in 1956 for the Corps of Engineers concluded that the probable maximum rainfall possible in this area was 28 in. in 6 hours and 31 in. in 12 hr. The previous record rainfall in Virginia was 8.4 in. in 12 hr at Big Meadows on the Skyline Drive, associated with a hurricane in 1942. For purposes of comparison, this catastrophic rainfall from Camille may be compared with the following records:

12 in. in 42 min. at Holt, Mo., in 1947
19 in. in 2 hr., 10 min., at Rockport, W. Va., in 1889
22 in. in 2 hr., 45 min. at D'Hanis, Tex., in 1935
31 in. in 4 hr., 30 min., at Smethport, Pa., in 1942
34 in. in 12 hr. at Smethport, Pa., in 1942.

The Virginia part of Camille was one of nature's rare events. It is estimated that the maximum rainfall associated with this storm has a return period well in excess of 1,000 yr. Another measure of the rarity of this rainfall is that the maximum amount of 31 in. (unconfirmed) approaches the probable maximum rainfall that meteorologists have computed to be theoretically possible in Virginia at this time of the year. The U. S. Geological Survey estimates that the return period of the crest discharge for the James River at Cartersville, Va., is 200 yr. Even longer return periods are estimated for crest discharges at upstream stations.

Camille's remnants dumped heavy rain over southern Maryland, including the southern Eastern Shore late on the 19th. Rainfall was heaviest over the southern Maryland counties of Worcester, Somerset, Wicomico, Dorchester, St. Marys, and Calvert and over Sussex County in Delaware; amounts ranged from 3 to near 6 in. in these sections. Flooding was mainly restricted to basements; several families living in trailers at Great Mills were evacuated. In this area of St. Marys County some bridges and secondary roads were washed out. There were no deaths or injuries in the two-state area.

FLOODS

The torrential rains associated with the remnants of hurricane Camille caused one of the worst flood disasters to strike the State of Virginia.

Extensive severe flash flooding occurred in the following counties: Albemarle, Allegheny, Amherst, Bath, Botetourt, Buckingham, Cumberland, Fluvanna, Goochland, Nelson, Orange, Powhattan and Rockbridge (fig. 8). Hardest hit by the flash flooding were the Tye River and Rockfish River Basins, which lie mostly within Nelson County. Flash flooding also reached disaster proportions in Rockbridge, Amherst, Albemarle, and Fluvanna Counties. Devastating and extreme flash flooding occurred in the Maury and Hardware Basins and in portions of the Rivanna Basin.

Most of the residents of the mountain hollows, hamlets, and towns were asleep during the fatal hours of the storm. Rapidly rising streams and landslides caused by the unprecedented rainfall destroyed homes as the occupants slept. Large trees were uprooted and hurled down the mountain. They acted as battering rams, crashing through houses, overturning automobiles, sparing nothing in their paths. Entire families were swept away in the raging waters. Whole sections of the mountainside slid down in the form of mud, heaping tons of silt on houses and their inhabitants. Many houses at higher elevations were damaged by mountain water runoff. Glasgow, at the junction of the Maury and James Rivers had its entire downtown area inundated by water over 14 ft. deep, flooding about 75 percent of its homes. Minor flooding occurred in Clifton Forge, Selma, Lowmoor, Rich Patch and Eagle Rock.

Record stages were reached on the Maury and Rivanna Rivers and on the James River in the reach from Holcombs Rock, Va., to Richmond, Va. (except at Lynchburg and Scottsville). See hydrographs and Tables 5 and 6. Crests along the James River exceeded all records of the 1936 flood, except at Lick Run and Buchanan (Table 5). The James exceeded all old flood marks and set new high stage records at Holcombs Rock, Bremo Bluff, Columbia, Cartersville and Richmond (Westham). In Lynchburg, water rose to its highest crest since 1870. Scottsville, located on a bend in the James River was described as a disaster area with water up to 12 ft. deep in its downtown district. At Bremo Bluff, low-lying houses and businesses were covered with water.

The heavy rains caused record flooding in the extreme headwaters of the Shenandoah River Basin on the South River near Waynesboro, Va. The Geological Survey reported that the crest of 15.3 ft. on the 20th was 0.5 ft. higher than the previous maximum stage recorded in 1942 (Table 5).

The remnants of Camille, as it moved through extreme southern West Virginia, produced 3 to nearly 5 in. of rain over the southern counties of that state. Nicholas, Greenbrier, and Summers Counties were hardest hit with flash flooding along the Greenbrier, Meadow and Cherry Rivers. The Greenbrier River at Alderson, W. Va., crested at 17.1 ft. early on the 20th; 3.1 ft. above flood stage. High water from Spring Creek, a small tributary entering the Greenbrier near Renick, W. Va., resulted in the deaths of two elderly women. Total damage in West Virginia was estimated at $750,000.

FLOOD DAMAGES

The Virginia Civil Defense Headquarters estimated the total flood damages in Virginia at $140 million. The total number of deaths in Virginia by drowning and mudslides was placed at 112 with an additional 41 persons missing and presumed dead (Table 1). The State was declared a disaster area by the President. One million dollars in federal aid was made available immediately for repair and replacement of roads, bridges and other public facilities.

The maximum number of fatalities and heaviest flood damage in Virginia occurred just east of the Blue Ridge Mountains in Nelson County. Of the 313 houses destroyed, 250 were located in Nelson County. Of the 415 houses suffering major damage, 225 of these were located in this county. Of the 153 people reported dead or missing in Virginia, 126 were residents of Nelson County -- a little more than 1 percent of the County's population; fifty-four persons were killed along a 4-mile stretch of Davis Creek and Huffman's Hollow. The

Table 4
SUPPLEMENTARY PRECIPITATION DATA

Storm of August 19-20, 1969
(Remnants of Hurricane Camille)

The following data were obtained by Weather Bureau personnel traveling through the James River Basin during the several days immediately following the disastrous flooding. Most of the rain fell during the 8-hour period beginning about 7 p.m. on the 19th. Wide publicity was given to a report of 31 inches near Tye River, Va. Attempts to verify this measurement were unsuccessful.

County	Latitude	Longitude	24-Hour Total	Type of Gage	Accuracy	Remarks
Nelson	37° 49'	79° 00'	27"	Trash barrel	Good	Barrel had been emptied afternoon before rain began.
Nelson	37° 45'	78° 56'	25"	Barrel	Good	
Nelson	37° 40'	78° 58'	23"	Street trash container	Good	On R. 29 between Amherst and Lovingston Container was 14" dia., 28" deep
Fluvanna	37° 56'	78° 18'	21" +	Plastic trash basket	Good	Container overflowed
Nelson	37° 41'	78° 58'	20.4" +	Plastic garbage container	Good	Container overflowed was 17.5" dia. at top and 15.5" dia. at bottom, 23" deep
Nelson	37° 48'	78° 59'	16"	---	Fair	2 miles NE of Massies Mill
Nelson	37° 51'	78° 49'	14" +	Comm. rain gage	Good	At foot of Davis Creek Gage overflowed
Nelson	37° 42'	78° 52'	14"	---	---	
Nelson	37° 46'	78° 59'	13" +	13" cylindrical bucket	Good	Bucket overflowed
Nelson	37° 43'	79° 00'	13" +	Ice cream freezer	Good	On R. 158 Freezer was filled to overflow hole
Fluvanna	37° 55'	78° 21'	13" +	Paint bucket	Good	Bucket overflowed
Albemarle	37° 58'	78° 24'	13" +	Paint bucket	Good	Bucket overflowed
Albemarle	37° 54'	78° 40'	13"	Cylindrical bucket	Good	Bucket did not overflow
Fluvanna	37° 54'	78° 15'	12.5" +	5" fence post gage	Good	Gage was emptied several times during night--but it had already overflowed before it was emptied first time
Albemarle	38° 00'	78° 43'	12" +	Cement cistern pipe	Fair	Pipe 24" diameter and 24" deep was about half full before rain and it overflowed

hamlets of Tyro, Massies Mill and Roseland on the Tye River were virtually destroyed. Woods Mill on the Rockfish River was partially or completely destroyed along with highways, bridges, utilities, railroads, and other properties. The villages of Rockfish, and Schuyler were severely damaged. Norwood, a small residential section along the James also suffered heavy damage. The water which was 5.5 ft. deep in the business district of Buena Vista caused severe damage to 60 businesses and major damage to 80 percent of the industries.

Some 200 miles of primary and secondary roads were washed out and 133 bridges were damaged or destroyed. Of these, 92 bridges were in Nelson County, 36 of them were classified as "major" structures. Two bridges over the James River were washed out: one at Columbia and one at Howardsville. The worst damage occurred to Route 29 between Amherst and Charlottesville with five major washouts and 30 landslides. At one time, only one highway crossing Virginia was open for its entire length. The damages to highways and bridges totaled an estimated $19 million.

The four major railroads in the State were among the hardest hit industries with several bridges destroyed and much track washed out. Most passenger service was maintained although delayed and rerouted over other track.

The tributaries of the York River also flooded with one fatality and serious property and crop damage. The major counties affected were Louisa, Caroline, Hanover, and King William. Several dams in the area broke; the largest was the one at the 300-acre Lake Louisa in Blue Ridge Shores.

FLOOD WARNINGS ISSUED BY ESSA WEATHER BUREAU

Many lives were saved and much property damage prevented by the flood warnings issued by the Weather Bureau for the middle and lower James River Basin in Virginia. Residents worked frantically to evacuate people, move goods and protect property. Damage along the James River was heavy because of the record-breaking nature of the flood, but loss of life was limited. Richmond with a 36-hr. warning, was well-prepared for the flood crest. Low lying areas of the city were flooded when a sewage pumping plant backed up through the sewer lines. Little warning was possible in the headwaterstreams as only one report of excessive rain was received by the Weather Bureau during the night. Rapidly rising streams and landslides caused by the unprecedented rainfall tore out communication lines and roads, preventing inhabitants from being alerted. Two towns, Buena Vista and Covington, alerted by rapidly rising stages, evacuated their citizens with the loss of one life.

ACKNOWLEDGMENTS

1. Edgar J. Saltzman, State Climatologist, Mississippi for a detailed summary of the storm and damages.
2. George W. Cry, State Climatologist, Louisiana for a detailed summary of the storm and damages.
3. John Vaiksnoras, State Climatologist, Tennessee for a detailed summary of the storm rainfall.
4. Robert O. Weedfall, State Climatologist, West Virginia for a detailed summary of the storm rainfall.
5. Curtis W. Crockett, State Climatologist, Virginia for a detailed summary of the flooding and damages in Virginia.
6. W. Joseph Moyer, State Climatologist, Delaware-Maryland for summary of rainfall.
7. National Hurricane Center for preliminary analysis and track of Camille.
8. New Orleans Weather Bureau Office for much original data.
9. M. M. Richards, Chief, Hydrologic Services Division for general guidance in preparation of hydrologic material.
10. Joseph T. Harden, Meteorologist in Charge, Weather Bureau Office, Richmond, Va., for furnishing basic data for preparation of river stage hydrographs, hydrologic tables and report on flooding in Virginia.
11. U. S. Geological Survey, Richmond, Va., for coordination of crest stage data and supplemental gage height information.
12. U. S. Geological Survey, Washington, for storm surge charts.
13. The Virginia Civil Defense Headquarters for flood damage information in Virginia.
14. American Red Cross and Office of Emergency Preparedness for information on total number of lives lost and damages.

° Includes crop damage
C Crop damage

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
\# Freezing drizzle and freezing rain, commonly known as glaze.
ø For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, ESSA, monthly publication STORM DATA.

\+ Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5,000,000
7 $5,000,000 to $50,000,000
8 $50,000,000 to $500,000,000
9 $500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

AUGUST 1969

Elmer R. Nelson, Office of Hydrology

The most disastrous flooding in the Nation during August, in lives lost and property damage, resulted from the torrential rains associated with tropical depression "Camille" in the James River Basin in Virginia. Record stages were reached on the Maury and Rivanna Rivers and on the James River in the reach at and below Holcombs Rock, Va. The total flood damages were estimated at $140 million and the total lives lost at 112 with an additional 41 persons missing and presumed dead.

ATLANTIC SLOPE DRAINAGE

Heavy rain on the 3d and 4th caused flooding on the Housatonic and Farmington Rivers in Connecticut. Some minor flash flooding was reported in western Massachusetts, western Connecticut, and in isolated sections of New Hampshire and Maine. Rainfall during the first week of August, mainly on the 3d and 4th, ranged from 4 to 6 inches in western Connecticut to isolated amounts of 7 to 10 inches in parts of northern Maine and in some mountainous areas of New Hampshire. The heaviest flood damage occurred in Connecticut and was estimated at $528,000 by the Connecticut State Civil Defense. A state of emergency was declared in New Milford, Torrington, and New Hartford, Conn. The main damage was in the form of road washouts, landslides, cellar flooding and evacuations.

Heavy thunderstorms during the evening of Aug. 1 cuased severe flash flooding in small headwater streams of the Lehigh and Schuylkill Rivers in east central Pennsylvania. Four to 6 inches of rain was recorded in the Tamaqua-Lehighton, Pa., area. Extensive damage resulted to the communities of Tamaqua, Jim Thorpe, and Port Carbon. In Tamaqua, over 6 inches of rain washed silt down the mountains into the Wabash Creek, which joins the Little Schuylkill in Tamaqua. The waters of the Little Wabash which are carried under Tamaqua by a stone archway proved inadequate to handle the large volume of water. Flood waters poured into the town and left deposits of silt along with damage to public and private property. Surrounding sections of Schuylkill County reported damage to both public and private property with total damage estimated slightly over $1 million. About 2,000 residents were evacuated during the flooding. In Jim Thorpe, extensive damage was reported to roads, houses, and storm sewers due to overflow of Mauch Chunk creek. Damage in Jim Thorpe and surrounding Carbon County was estimated at around $260,000. Both Schuylkill and Carbon Counties were granted disaster status by the Federal Government.

Heavy rainfall (1 to 3 inches) on Aug. 3 caused some flash flooding in southeastern Pennsylvania and northern New Jersey. Damage was minor.

Heavy rains during the afternoon of Aug. 4 caused minor flooding on the lower Neshaminy River in southeastern Pennsylvania. Some flash flooding was reported from southern Pennsylvania across New Jersey. The heavy rains along with previous heavy rainfalls raised lake levels in many sections of northern New Jersey. In Passaic County, dams at Lookover and Pinecliff Lakes were spilling. Additional sandbagging and bulldozing were required during the evening of Aug. 4 to prevent major flooding. Around 200 persons were evacuated from the vicinity of west Milford.

Widespread heavy showers and thunderstorms during the afternoon and evening of Aug. 15 caused severe flash flooding in northeastern New Jersey. A state of emergency was declared in Clark, N. J. (3 miles northwest of Rahway) when water reached 6 feet deep in some places. Some people were evacuated by boat from the Oakridge Road area where water was almost 8 feet deep. Another area of heavy rainfall in Passaic and Bergen Counties caused severe flash flooding in the communities of Clifton, Garfield, Passaic, and Lodi, N. J.

Heavy showers in the Washington, D. C., metropolitan area on the night of the 9th caused flash flooding on Sligo Creek in Silver Spring-Takoma Park, Md., area and on Four Mile Run at Arlandria, Va. This was the second consecutive month with flooding on Four Mile Run. The Corps of Engineers estimated the flood damages at $740,000 in Four Mile Run Basin and $200,000 in Sligo Creek Basin. Two lives were lost during rescue attempts on flooded Sligo Creek in Takoma Park, Md.

Cumulative rainfall during the first 6 days of August caused light flooding in streams in eastern North Carolina. A moderate rise along the upper Cape Fear River resulted in rises 4 to 5 feet over bankfull stages in the lower reach. The Neuse River exceeded flood stage by 2 to 4 feet at most gaging points. Crests along the Tar River were 0.3 foot or less above flood stage. No damage was reported.

Nine to 10 inches of rain in 24 hours caused flash flooding of small streams in the City of Dillon, S. C., on the afternoon of the 1st through the 2d. One fatality occurred when a youth was drowned in a drainage ditch. Damage was minor. Moderate flooding occurred on the Lumber River at Lumberton, N. C., from the 2d to the 27th. Flood damage was minor but inconvenience and disruption of activities was major. Approximately 100 houses in low lying areas had water 1 to 2 ft. deep in their yards. Flooding and damage along the Little Pee Dee River at Galivants Ferry, S. C., on the 6-26th was minor.

THE VIRGINIA FLOODS
AUGUST 19-22, 1969

Torrential rains associated with the remnants of Hurricane Camille during the night of Aug. 19-20 caused one of the worst natural disasters to strike the State of Virginia.

After striking the Mississippi coastline late on Aug. 17, Hurricane Camille had moved inland on Aug. 18 and 19, weakening steadily as it passed over Mississippi, Tennessee, and Kentucky, into West Virginia. Rainfall had diminished from nearly 8 inches in southern Mississippi to 1 to 2 inches in eastern Kentucky.

The weak and seemingly innocuous low pressure center during the afternoon of Aug. 19 turned abruptly eastward and crossed the Blue Ridge mountains into southwestern Virginia. Heavy rains associated with thunderstorms began about 7:00 p.m. on Aug. 19 and continued without decrease in intensity for the next 8 hours. The heaviest rainfall occurred in the Tye River Basin in the central part of Nelson County where confirmed amounts of 25 to 27 inches were obtained during a "bucket survey." One unconfirmed amount of 31 inches was obtained near Tye River, Va. Rainfall amounts of 12 to 14 inches were fairly widespread in Nelson County and in the southern part of Albemarle County. Rainfall in excess of 4 inches fell over an area 30 to 40 miles wide and more than 130 miles long.

The torrential rains caused extensive and severe flash flooding in Albemarle, Allegheny, Amherst, Bath, Botetourt, Buckingham, Cumberland, Fluvanna, Gooch-

land, Nelson, Orange, Powhattan, and Rockbridge Counties. The hardest hit by the flash flooding was the Tye River and Rockfish River Basins, most of which lie within Nelson County, Va. Flash flooding reached disaster proportions in Rockbridge, Amherst, Nelson, Albemarle, and Fluvanna Counties. Devastating and extreme flash flooding occurred in the Maury and Hardware Basins and in portions of the Rivanna Basin.

Record stages were reached on the Maury and Rivanna Rivers and on the James River in the reach from Holcombs Rock, Va., to Richmond, Va., (except at Lynchburg and Scottsville). In the Maury Basin, the towns of Buena Vista and Glasgow which were inundated up to 14.2 feet were evacuated without the loss of life. The 31.2-foot crest at Buena Vista was 9.2 ft. higher than the previous record crest recorded in 1936. Along the main stem of the James River, crest stages exceeded all records of the 1936 flood except at Lick Run and Buchanan. At Holcombs Rock, Bremo Bluff, Columbia, Cartersville, and Richmond (Westham), the James River exceeded all old flood marks and set new high records.

Flash flooding occurred in the extreme headwaters of the Shenandoah River Basin where the Geological Survey reported that the South River near Waynesboro, Va., reached a record stage of 15.3 ft. on Aug. 20. This was 0.5 ft. higher than the previous maximum stage of 14.8 ft. recorded on Oct. 15, 1942.

Most of the residents of the mountain hollows, hamlets, and towns were asleep during the fatal hours of the storm. Little warning was possible--only one report of excessive rain was received by the Weather Bureau during the night from a cooperative observer. While it is not presently possible to forecast rainfall in the amounts received during this storm, many lives were saved and much property damage was prevented by the flood warnings issued by the Weather Bureau for the middle and lower James River Basin.

Rapidly rising streams and landslides caused by the unprecedented rainfall not only destroyed homes as the occupants slept, but tore out communication lines and roads, preventing downstream inhabitants from being alerted. Large trees were uprooted and hurled down the mountain. They acted as battering rams, crashing through houses, overturning automobiles, sparing nothing in their paths. Entire families were swept away in the raging waters. Whole sections of the mountainside slid down in the form of mud, heaping tons of silt on houses and their inhabitants. The communities of Massies Mill, Davis Creek, Roseland, Rockfish, and Woods were partially or completely destroyed along with highways, bridges, crops, and buildings.

Communications, including roads, were completely destroyed to many communities within the effects of the flash flooding. At one time, only one highway crossing Virginia was open for its entire length. The damages to highways and bridges alone totaled an estimated \$19 million. Some 133 bridges were destroyed or damaged and 25 miles of primary and 175 miles of secondary roads were washed out or obliterated by the floodwaters.

The Virginia Civil Defense Headquarters estimated the total flood damages in Virginia at \$140 million. The total number of deaths resulting from the Virginia floods were placed at 112 with an additional 41 persons missing and presumed dead. The State was declared a disaster area by the President. One million dollars in federal aid was made available immediately for repair and replacement of roads, bridges, and other public facilities.

EAST GULF OF MEXICO DRAINAGE

Minor flooding occurred on the Etowah River at Canton, Ga., on the 23d. The overflow was due to intense rainfall exceeding 2.5 inches in a few hours with a 36-hour total in excess of 4 inches. Damage was negligible.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--The Big Muddy River at Murphysboro, Ill., receded below flood stage on Aug. 4, after being in flood 117 days. The crest on July 17 was 11.25 ft. above flood stage.

Missouri Basin.--The James River at Stratford, S. Dak., receded within its banks on Aug. 29, after being in flood 141 days.

Minor flooding occurred on Thompson Creek at Riverton, Nebr., on the 31st. The South Fork of the Solomon River at Osborne, Kans., exceeded flood stage by 1 foot on Aug. 26. Ladder Creek near Scott City, Kans., reached a near record crest of 16.0 ft. on Aug. 23. This was the highest stage at this point in 36 years when it reached a record crest of 16.1 ft. on Aug. 3, 1933. The crest of 9.3 ft. on the Smoky Hill River at Elkader, Kans., on Aug. 23 was the highest stage in 31 years. Residents in the Russell Springs, Kans., area reported one of the worst floods in its history on the Smoky Hill River Channel on the 22-23. Record flooding occurred in the extreme upper portion of the Little Blue River near Deweese, Nebr. The crest of 17.07 ft. on the 31st was 1.1 ft. higher than the previous record crest of 15.99 ft. on May 22, 1965. Downstream at Hebron, Nebr., residents reported the highest water levels in 40 years. Extensive overflow moved slowly downstream to Fairbury, Nebr., on Sept. 3.

Ohio Basin.--Heavy rains occurred in southern West Virginia as the remnants of Hurricane Camille moved across the State on the 19th and 20th. The Meadow, Cherry and Greenbrier Rivers rose out of their banks on the 20th. Damages on the Meadow River in the Rainelle-Anjean-Rupert, W. Va., area were estimated in excess of \$1 million. Damages on the Cherry River in the Richwood, W. Va., area were estimated at \$77,500. Damages on the lower Greenbrier River were relatively minor and estimated at \$2,500. Spring Creek, a small stream entering the Greenbrier River near Renick, W. Va., flooded the lower floor of one residence, taking the lives of two elderly women who were trapped inside.

Minor flooding occurred on the White River at Anderson, Ind., on the 10th. This flooding was due to 2.5 inches in less than 48 hours. No damage resulted.

Red Basin.--Heavy rains of 2 to 6 inches in the eastern Texas Panhandle and western Oklahoma on the 25-27th caused rises in streams to near flood stage. The Salt Fork of the Red River at Mangum, Tex., rose briefly to near flood stage on the morning of the 28th. The North Fork of the Red River at Headrick, Okla., crested 1.5 ft. below flood stage on the 26th. The Washita River at Clinton, Okla., rose to within a foot of flood stage on the morning of the 27th. The Red River at Burkburnett, Tex., rose to near flood stage on the morning of the 28th. Only minor bottomland flooding resulted.

WEST GULF OF MEXICO DRAINAGE

Minor flooding occurred on Turkey Creek at Crystal City, Tex., towards the end of August. This flooding was due to 6.5 inches of rain on the 27th. Several highways in Maverick County were closed due to high water. Damages were limited to fences and washing

of highway shoulders.

Great Basin.--Severe thunderstorm with heavy rain at Salt Lake City, Utah, on Aug. 17 caused heavy damage when water impounded in a catchment basin broke through and sent torrents of water, mud and rocks into several homes. At least 15 homes sustained damages estimated at $100,000. Most of the rain fell between 5:45 p.m. and 6:15 p.m. with 2.2 inches reported near the center of the storm.

Flash flood conditions reported elsewhere in the Great Basin were as follows:

1. Monroe Canyon, 10 miles south of Richfield, Utah, on Aug. 3, Damage, $800.
2. Willow Creek, 3-5 miles northwest of Richfield, Utah, on Aug. 11. Damage, estimated at $3,300.
3. San Rafael drainage, west of Orangeville, Utah, on Aug. 18. Damage, estimated at $4,050.
4. Ferron, Utah, on Aug. 29. A dam structure on Ferron Creek was damaged and other damages were reported to irrigation works, crops and Forest Service roads. Damage estimated at $5,055.

PACIFIC SLOPE DRAINAGE

Sacramento-San Joaquin Delta.--Pumping continues on Sherman Island with most of the island now dry. A few deep pools remain. Much of the island has been planted with short term crops. State Highway No. 160 was reopened to traffic on Aug. 21.

Tulare Lake.--The elevation of the lake has decreased to 190.43 ft. m.s.l. as of Sept 1. This is almost one foot lower than on Aug. 4 and almost 2 ft. lower than at its highest elevation. It will probably be 2 to 3 years before the lake is again dry.

Note: All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

\+ Observations for these stations are scheduled at 0000 G.C.T.

† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the surface and higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun.

* Values corresponding to true solar noon

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a.m.) at Palmer, Alaska

AUGUST 1969

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	210	190	131	219	159	128	193	167	48	160	166	98	112	150	154	147	93	121	138	165	71	26	56	128	143	154	138	4	41	73	91	125

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the ESSA, Weather Bureau.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (< 3900 Å) at Ames, Iowa

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	16.93	19.53	18.58	11.36	13.85	18.58	14.56	13.49	14.68	14.56	14.56	13.85	11.24	15.98	12.07	17.52	15.98	13.14	9.47	4.85	14.20	15.51	15.86	12.66	15.03	12.31	11.36	14.20	15.62	11.48	3.55	13.76

These data are from an U - V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the ESSA, Weather Bureau.

TOTAL OZONE DATA

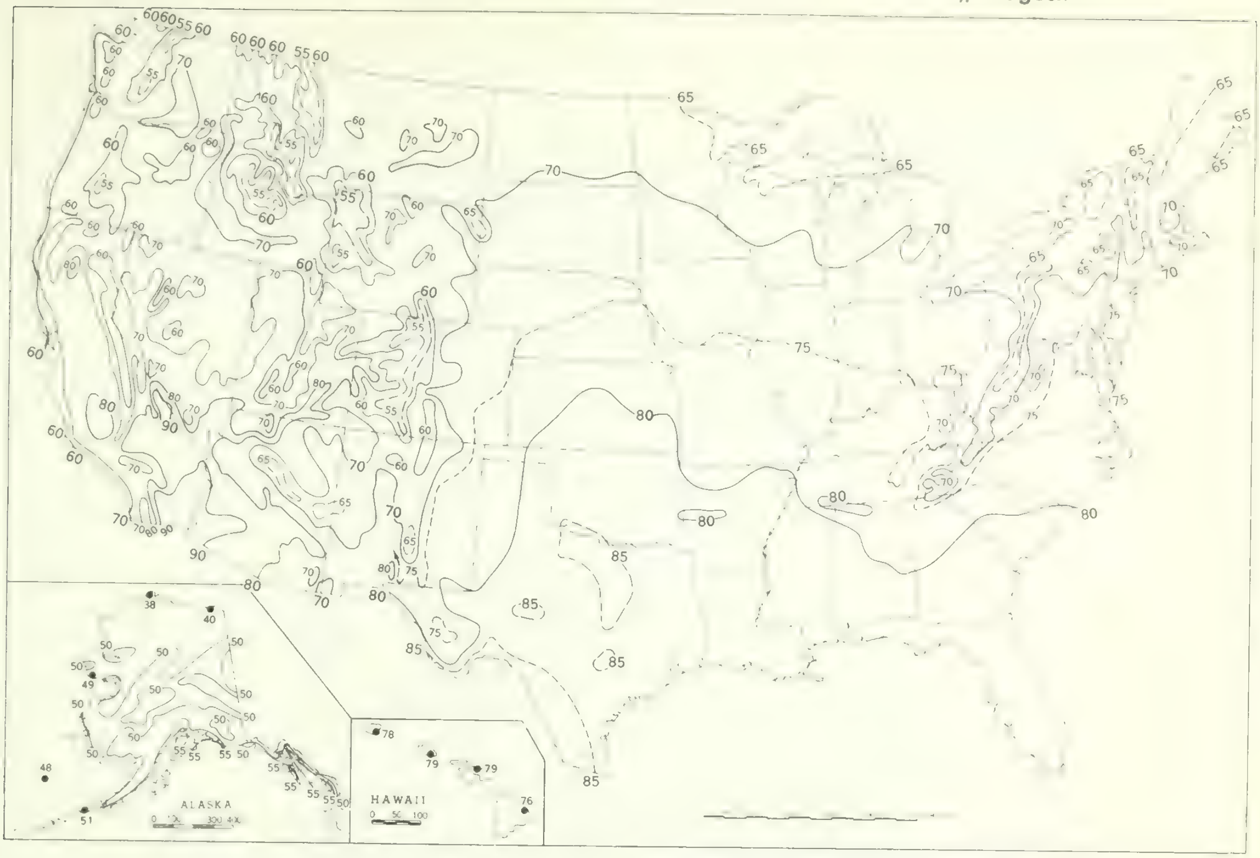
These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code ʌ s ϱ ϱ ϱ defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

Station	Day of month																														
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O_3
															Data will be delayed																	

The spectrophotometer measures the total amount of ozone in the atmosphere, i e , the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded ϱ ϱ ϱ) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e. g , 350 milli-atmo-cm. ozone implies an ozone layer 0 350 centimeter thick. The code ʌ s designates the type of measurement made

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), August.



B. Temperature Departure from 30 - Year Mean (°F 1931-60), August 1969.

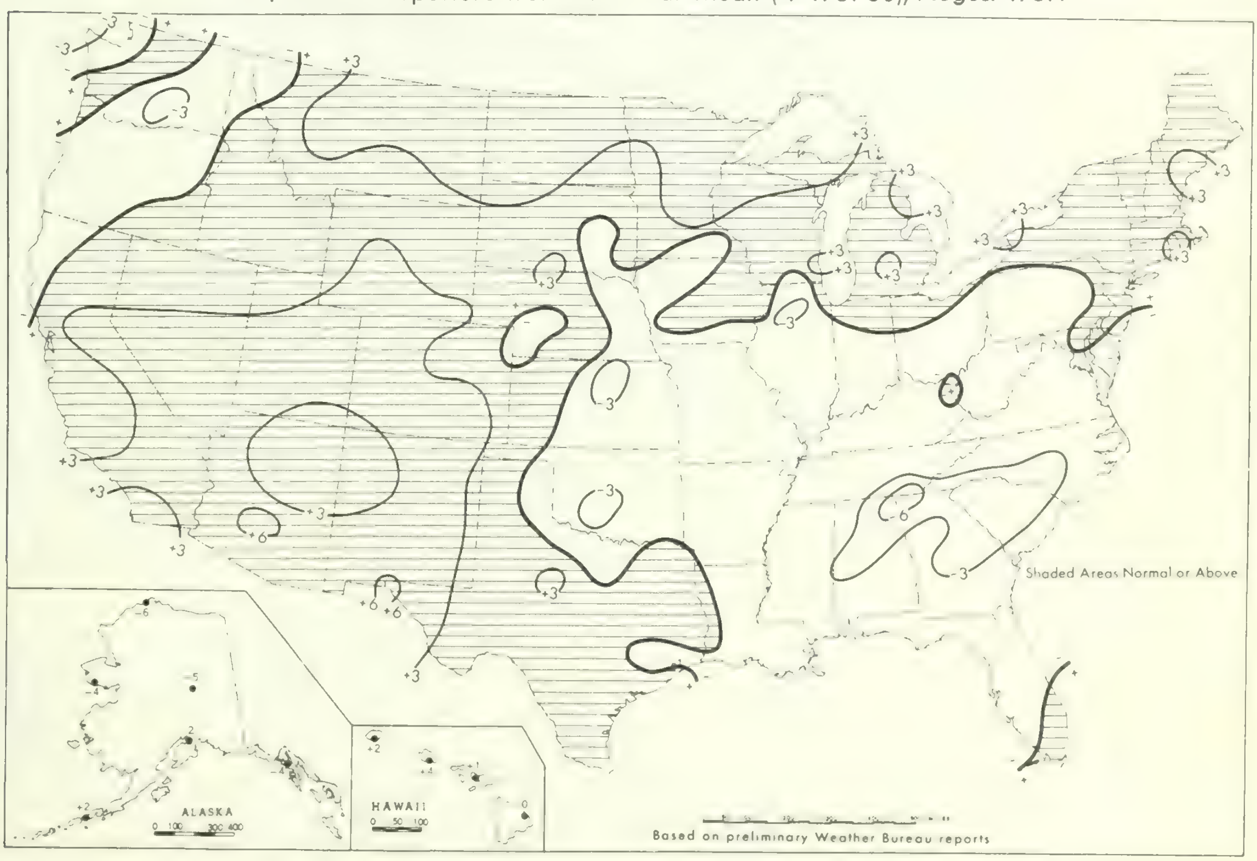


Chart II. Total Precipitation (Inches), August 1969.

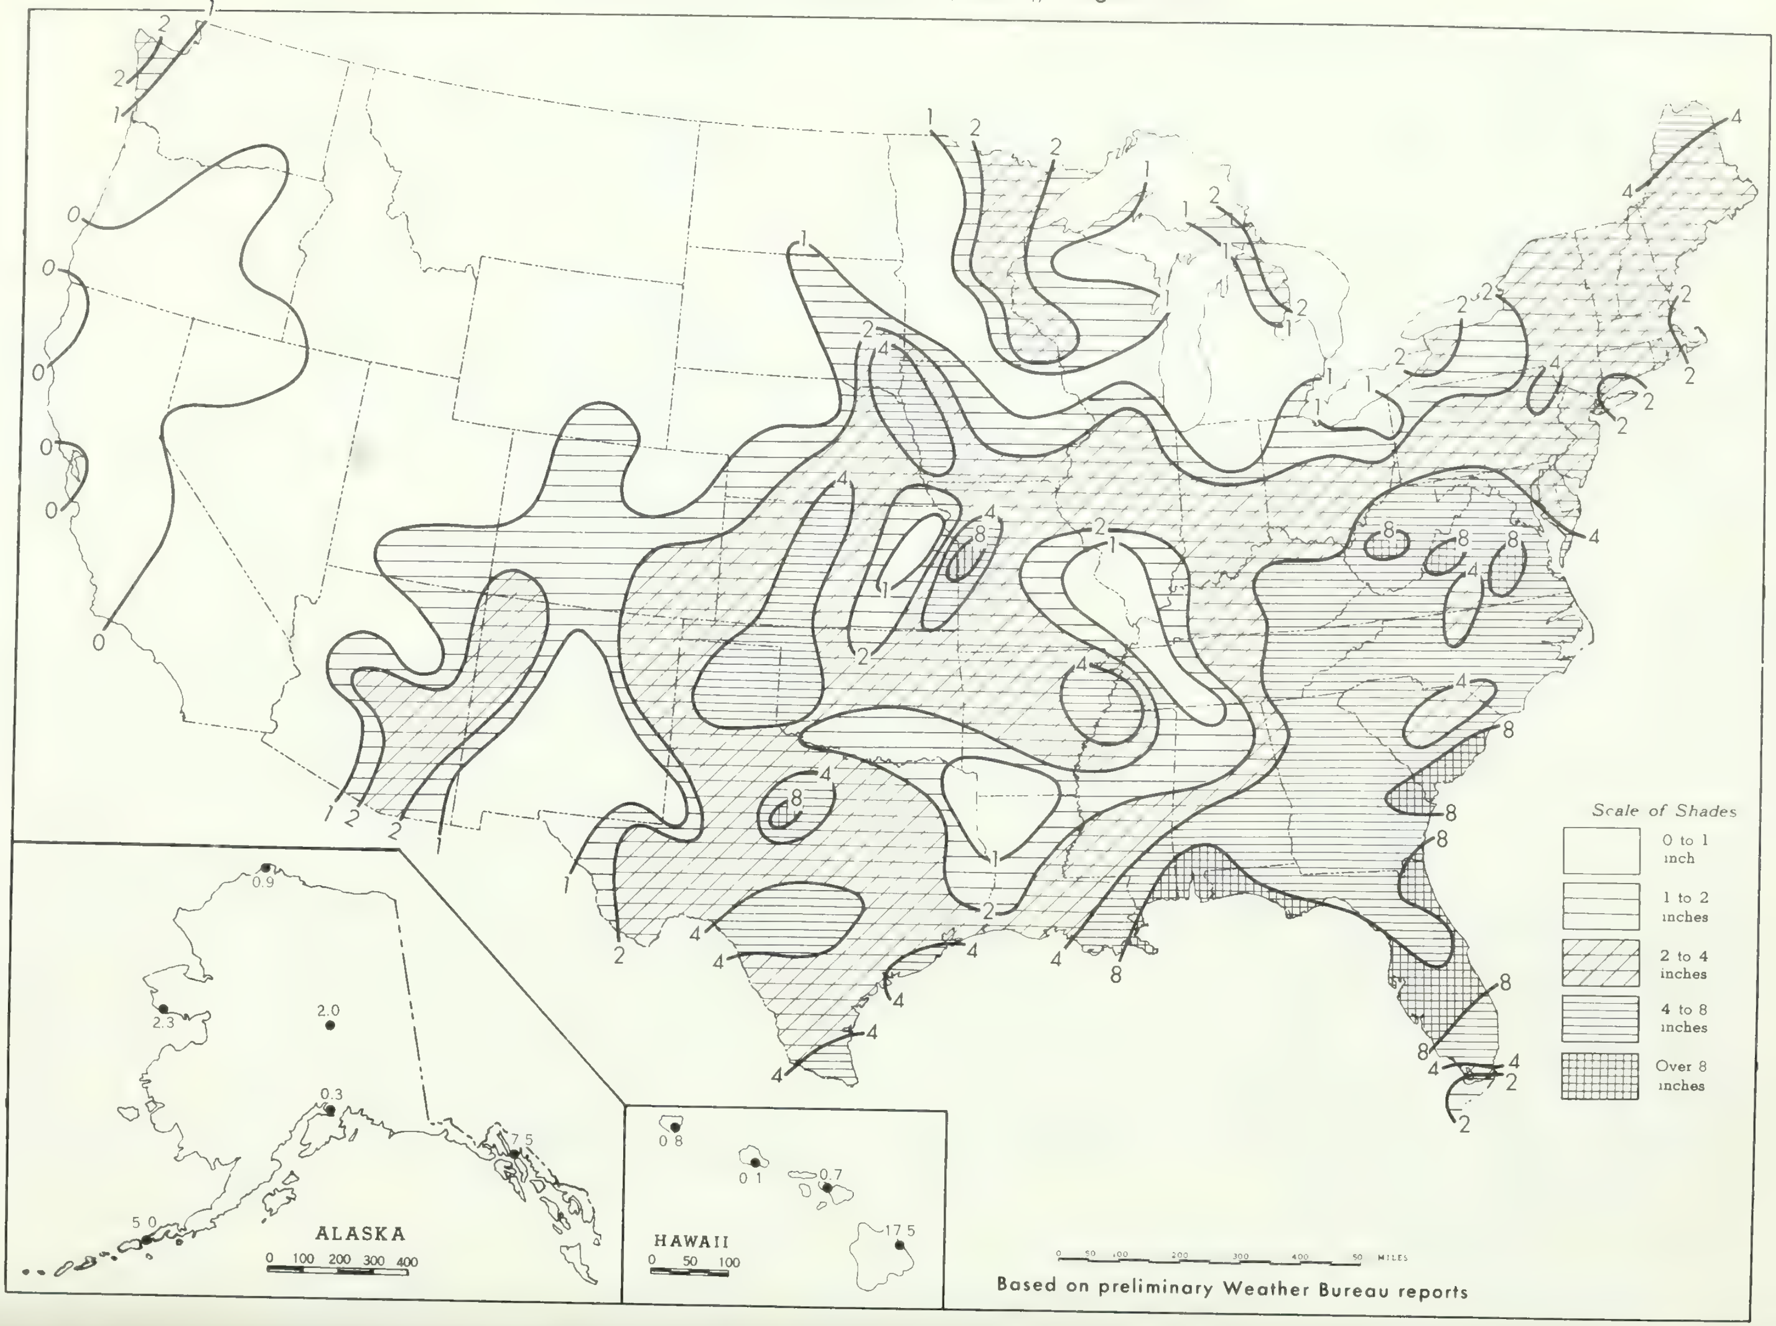

Based on preliminary Weather Bureau reports

Chart III. Percentage of Normal Precipitation, August 1969.

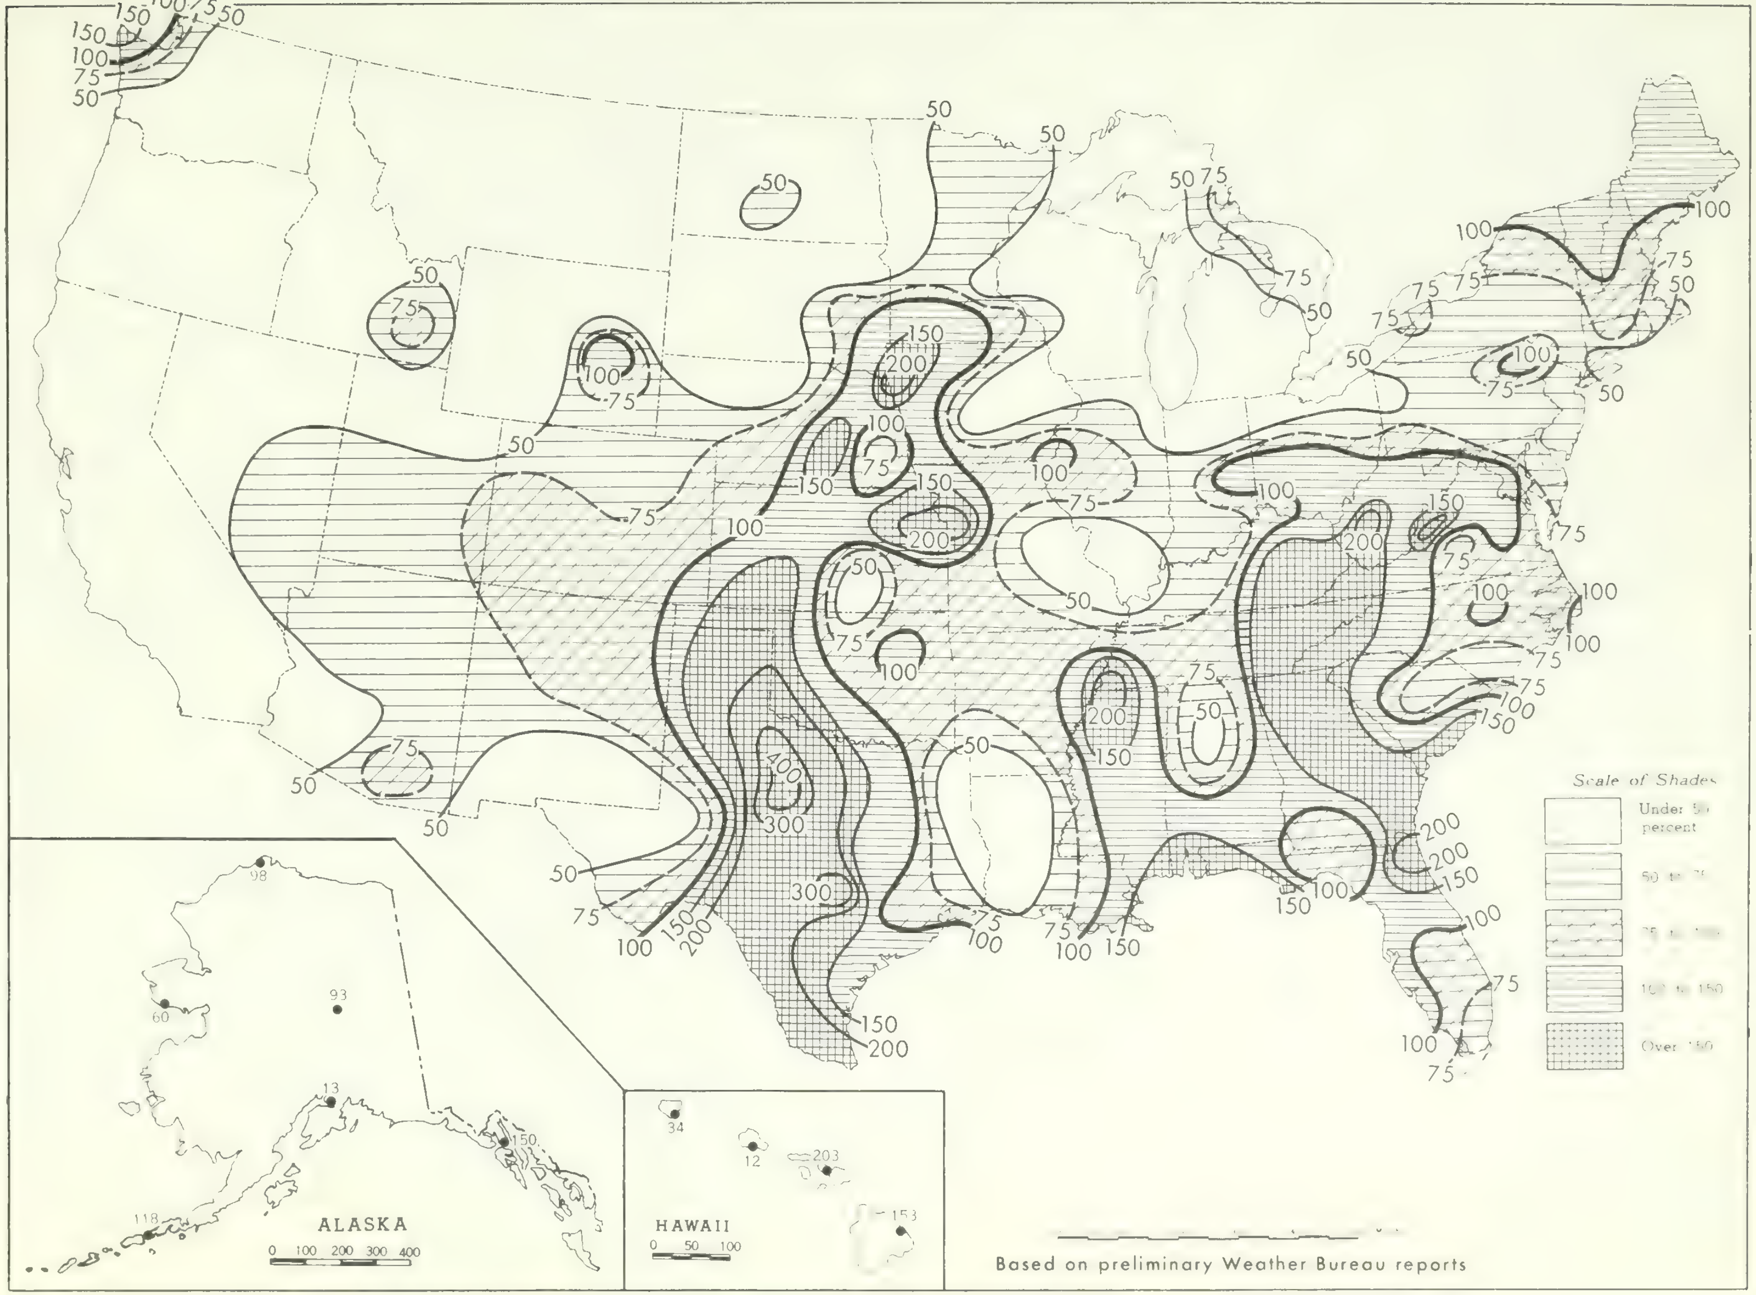

Chart VI. A. Percentage of Possible Sunshine, August 1969.

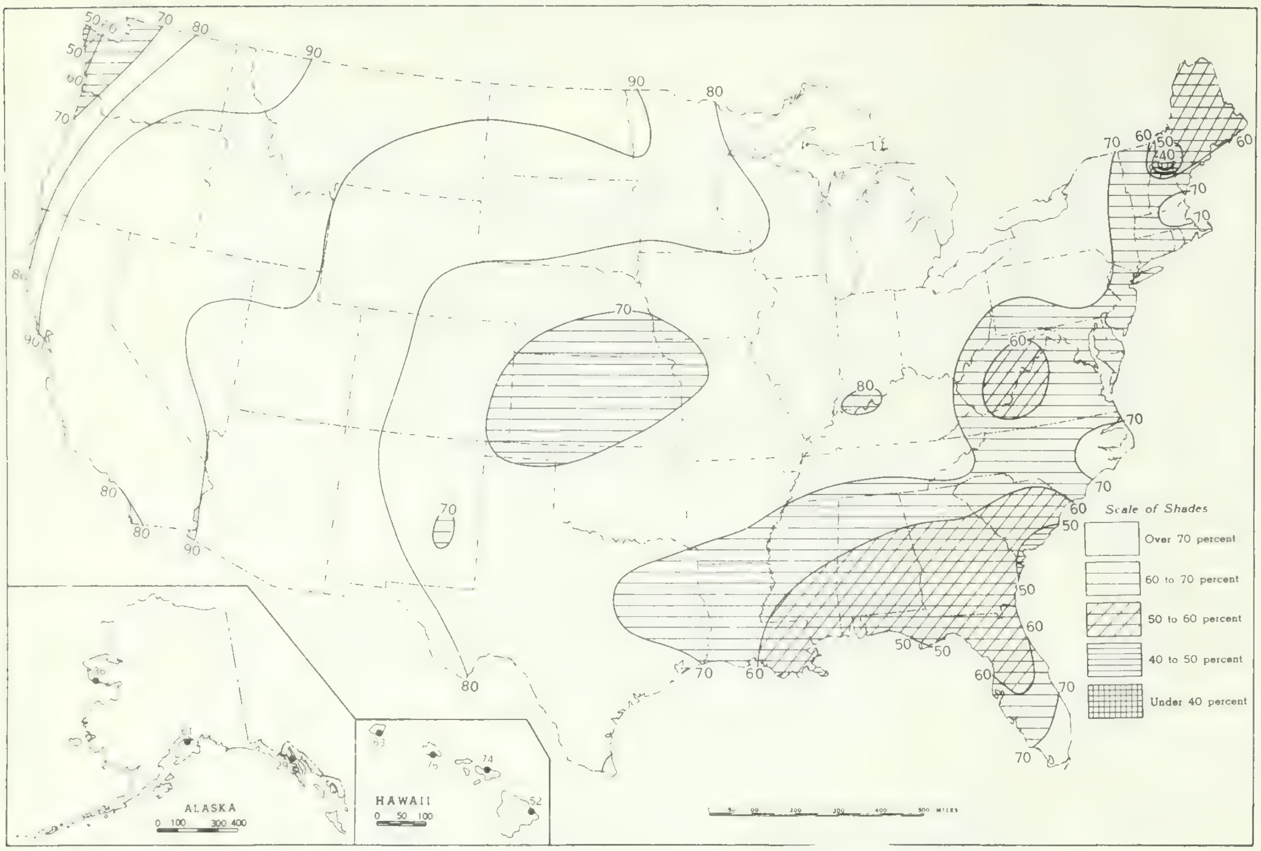
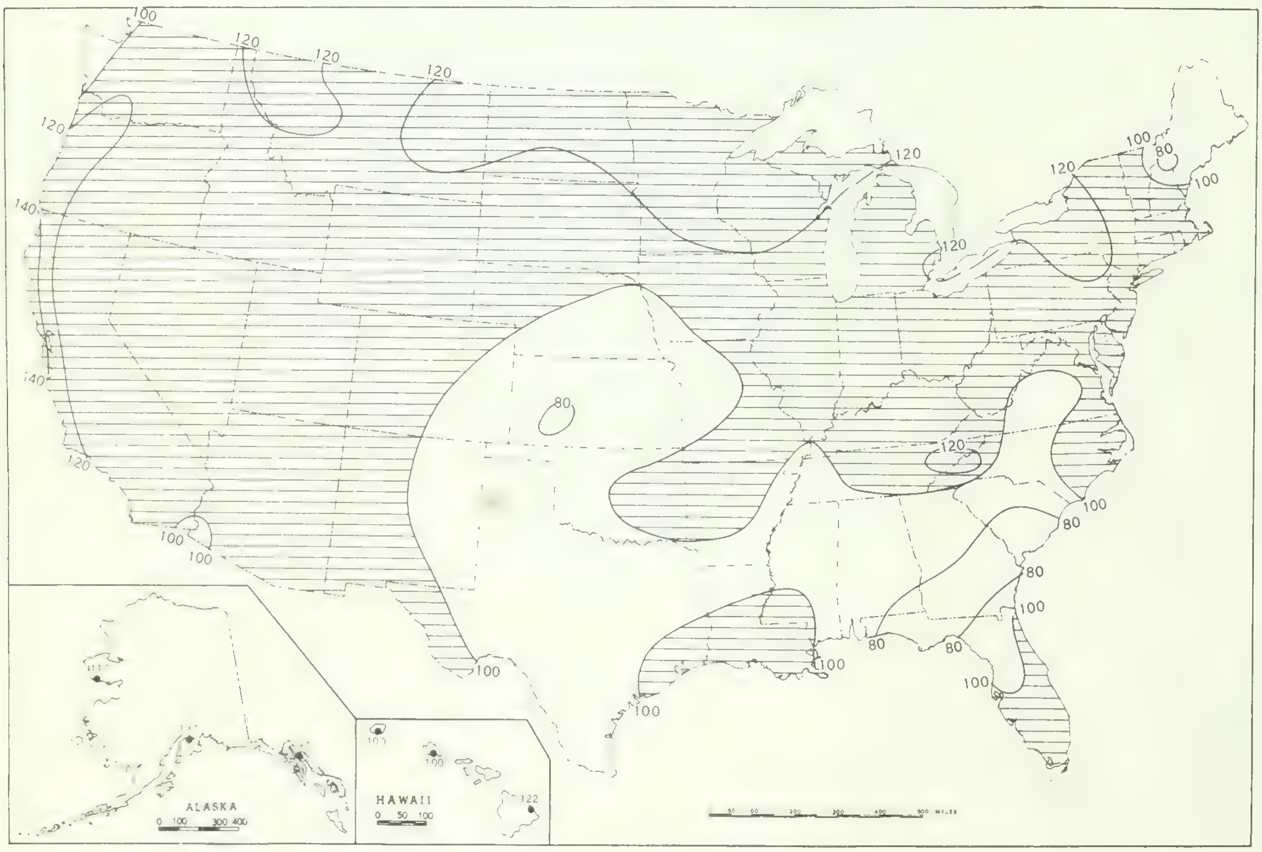
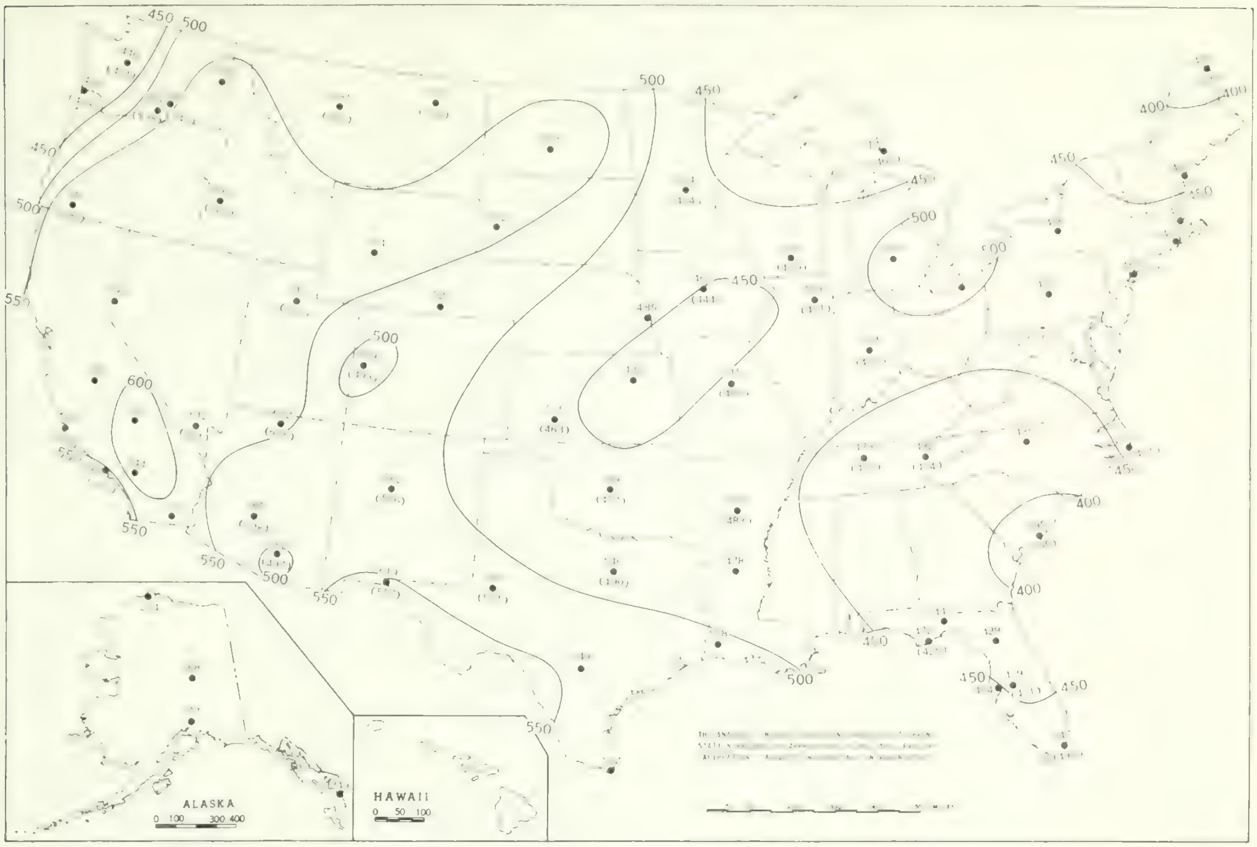


B. Percentage of Mean Monthly Sunshine, August 1969.

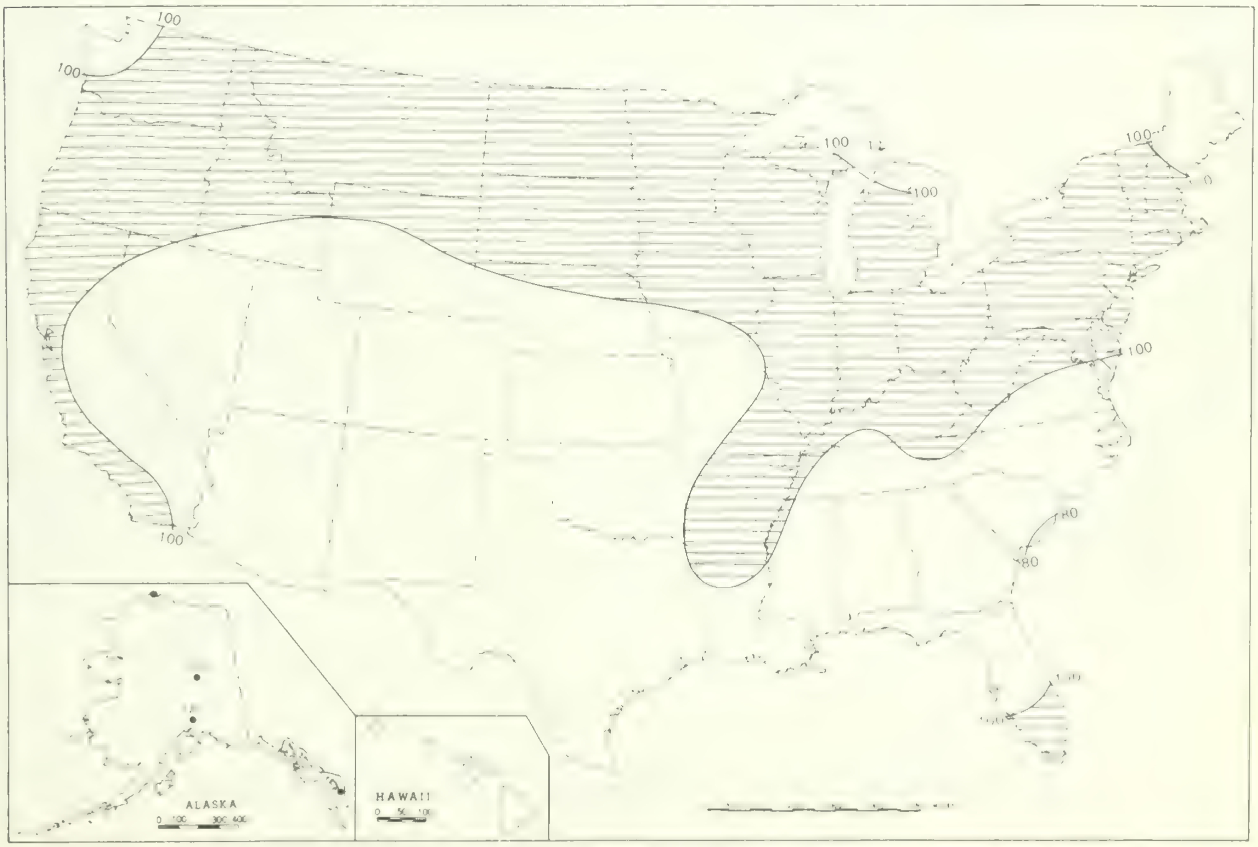


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, August 1969.

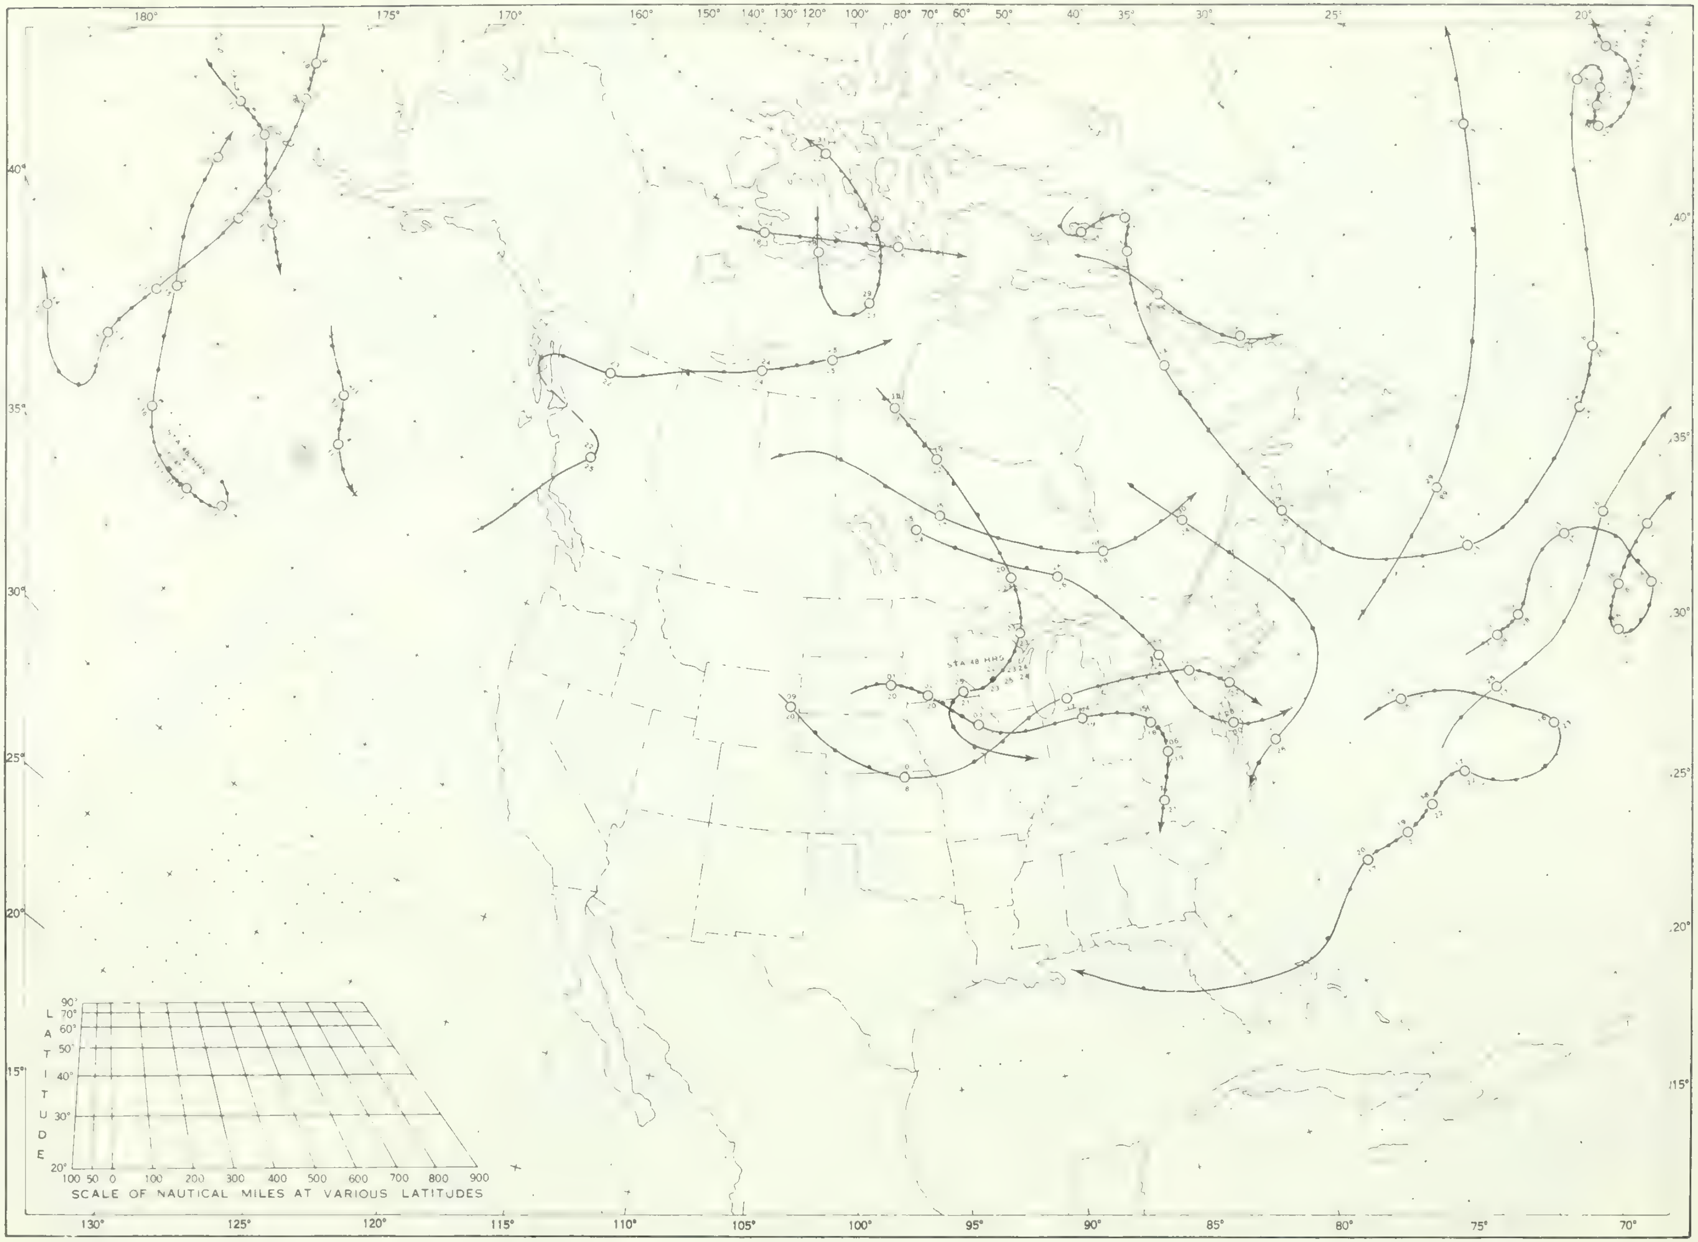


B. Percentage of Mean Daily Solar Radiation, August 1969.



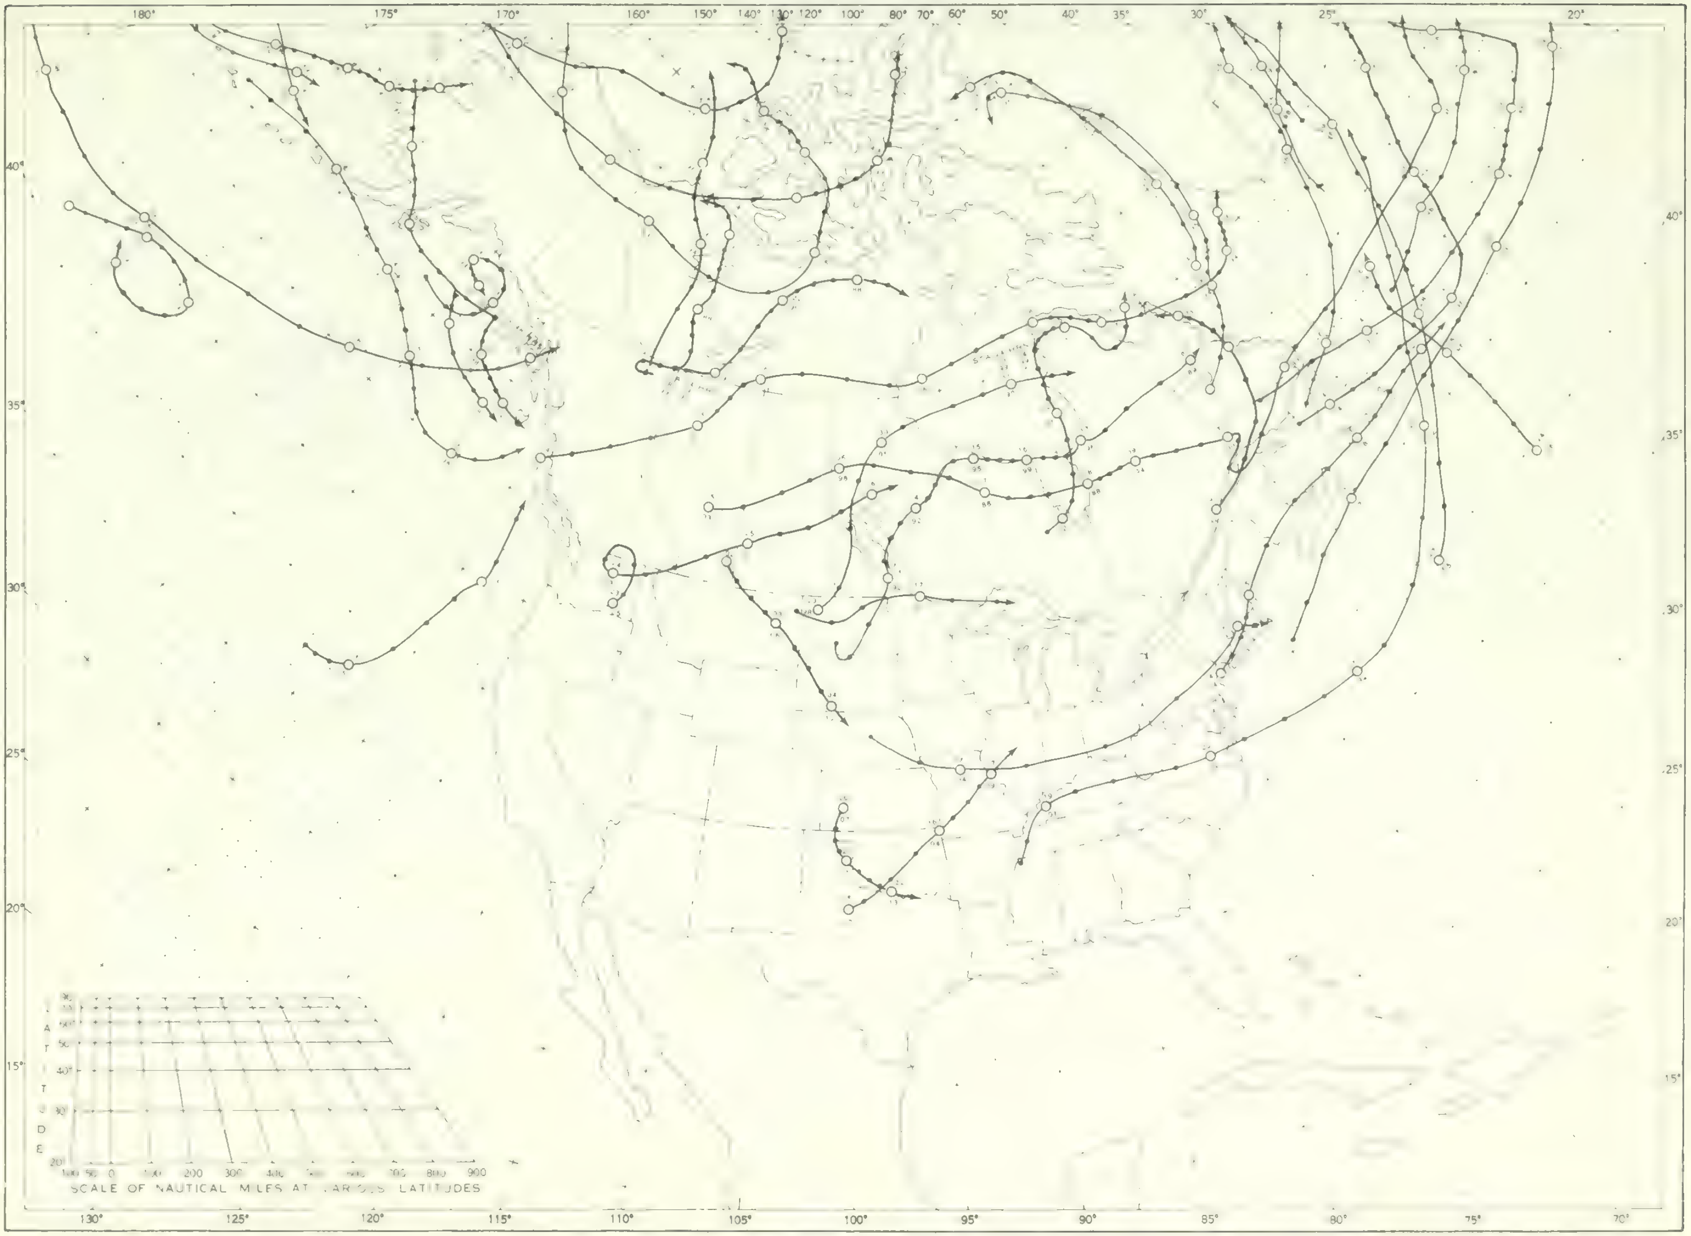
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII Tracks of Centers of Anticyclones at Sea Level, August 1969.



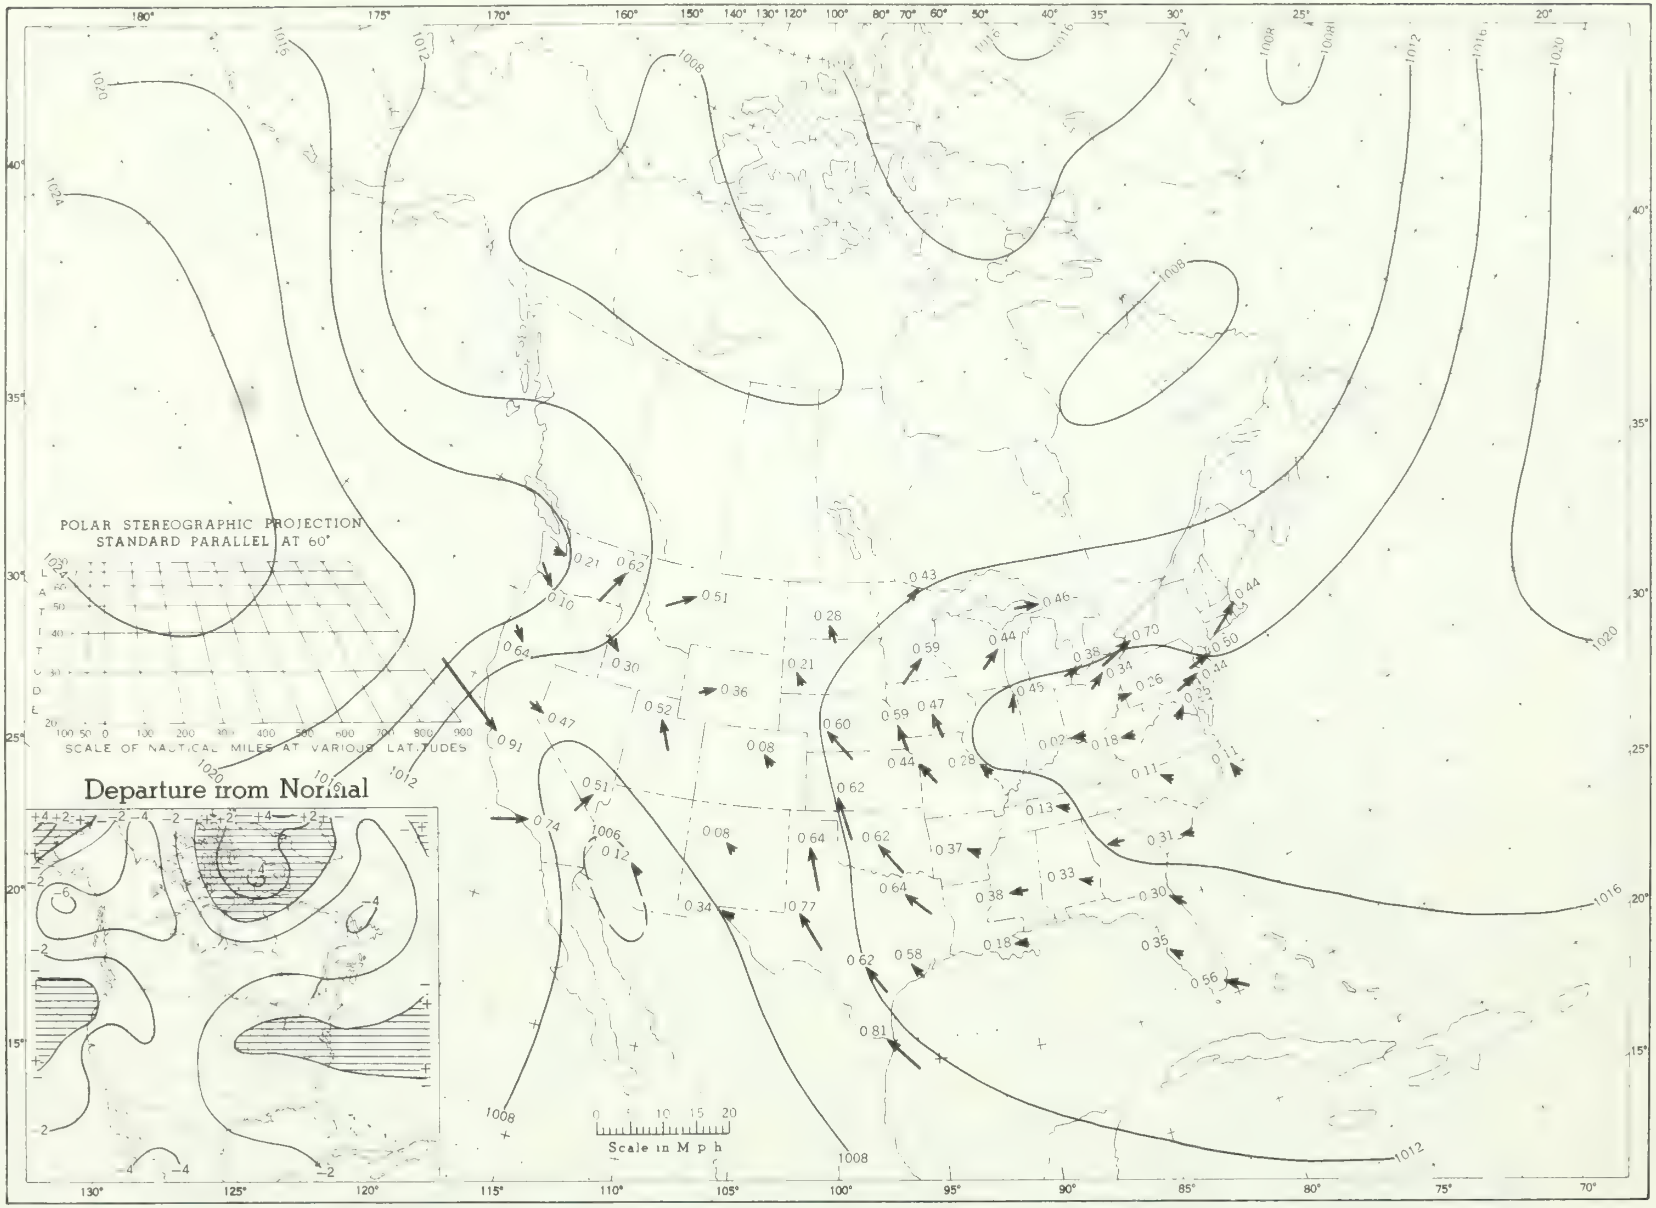
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX Tracks of Centers of Cyclones at Sea Level, August 1969.



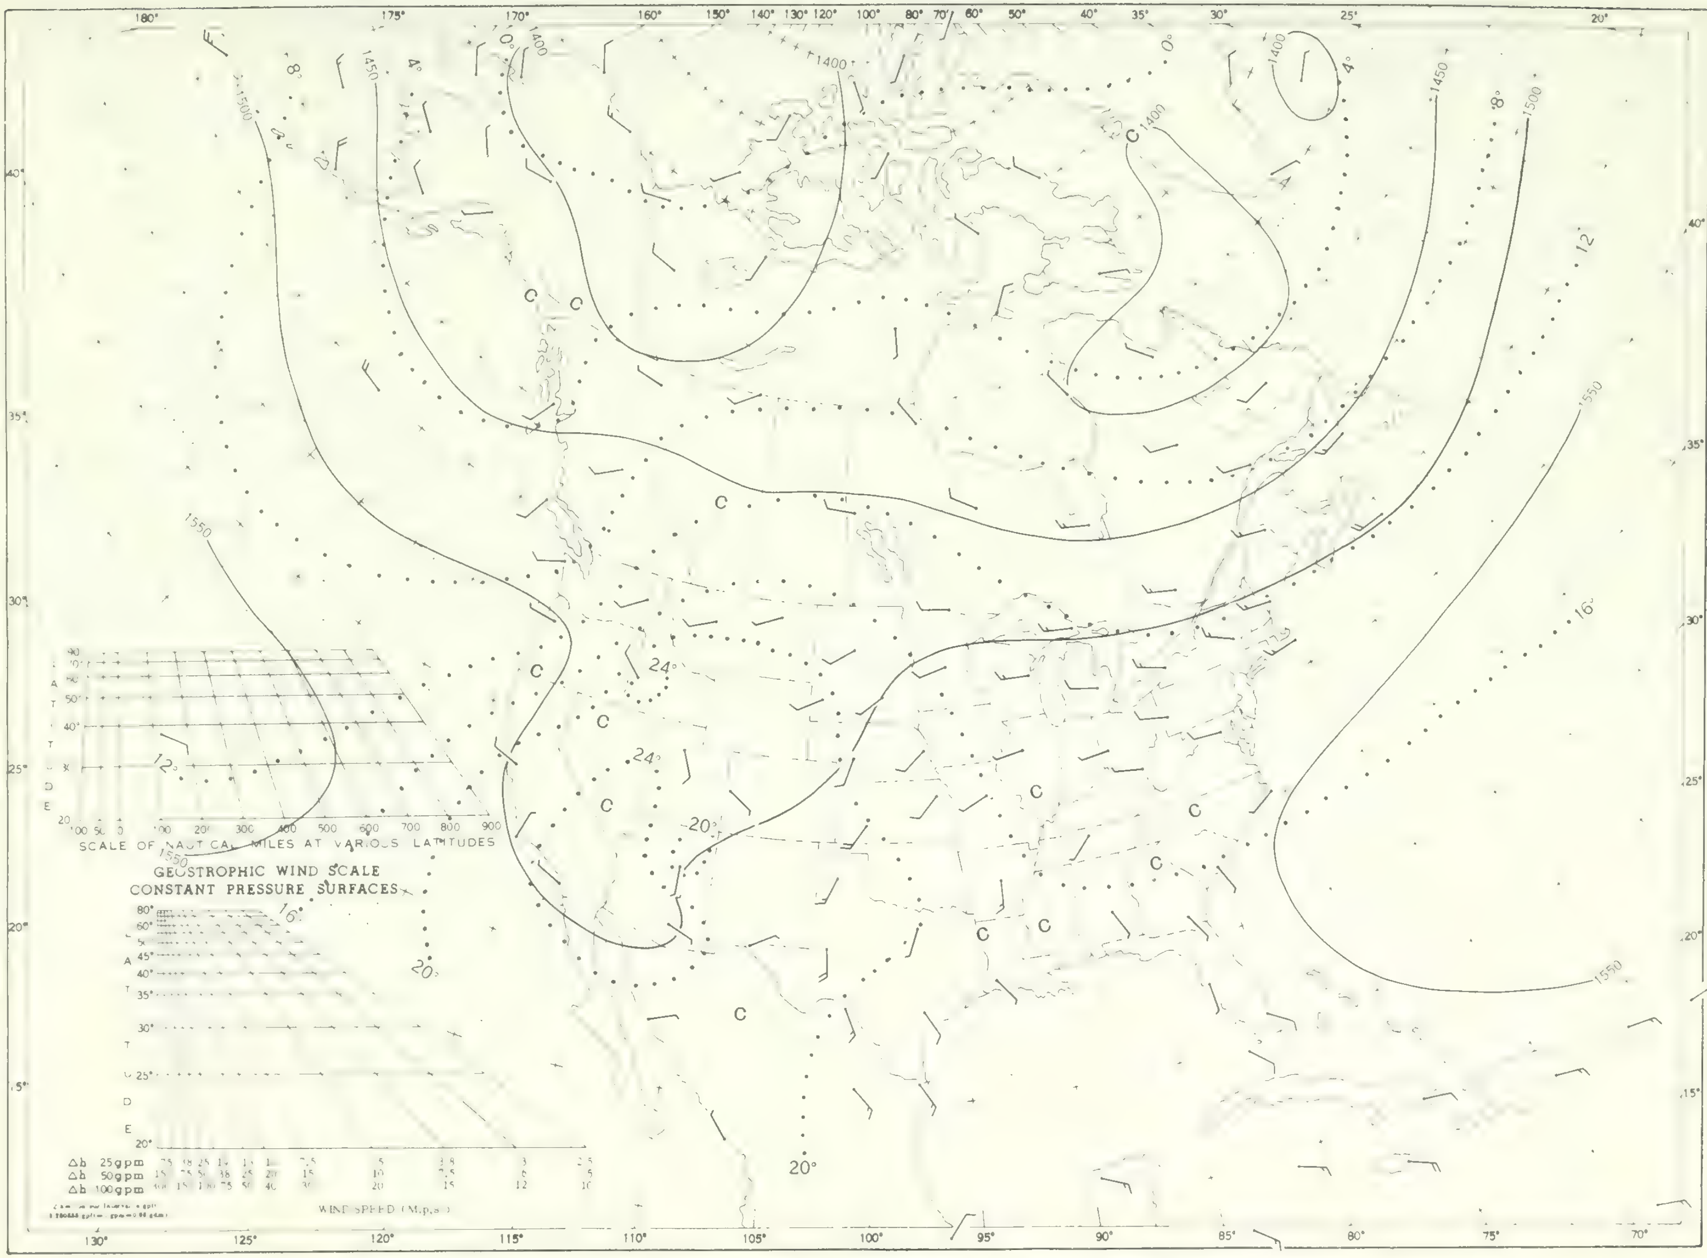
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X Average Sea Level Pressure (mb) and Resultant Surface Wind, August 1969. Inset Departure of Average Pressure (mb) from Normal, August 1969.



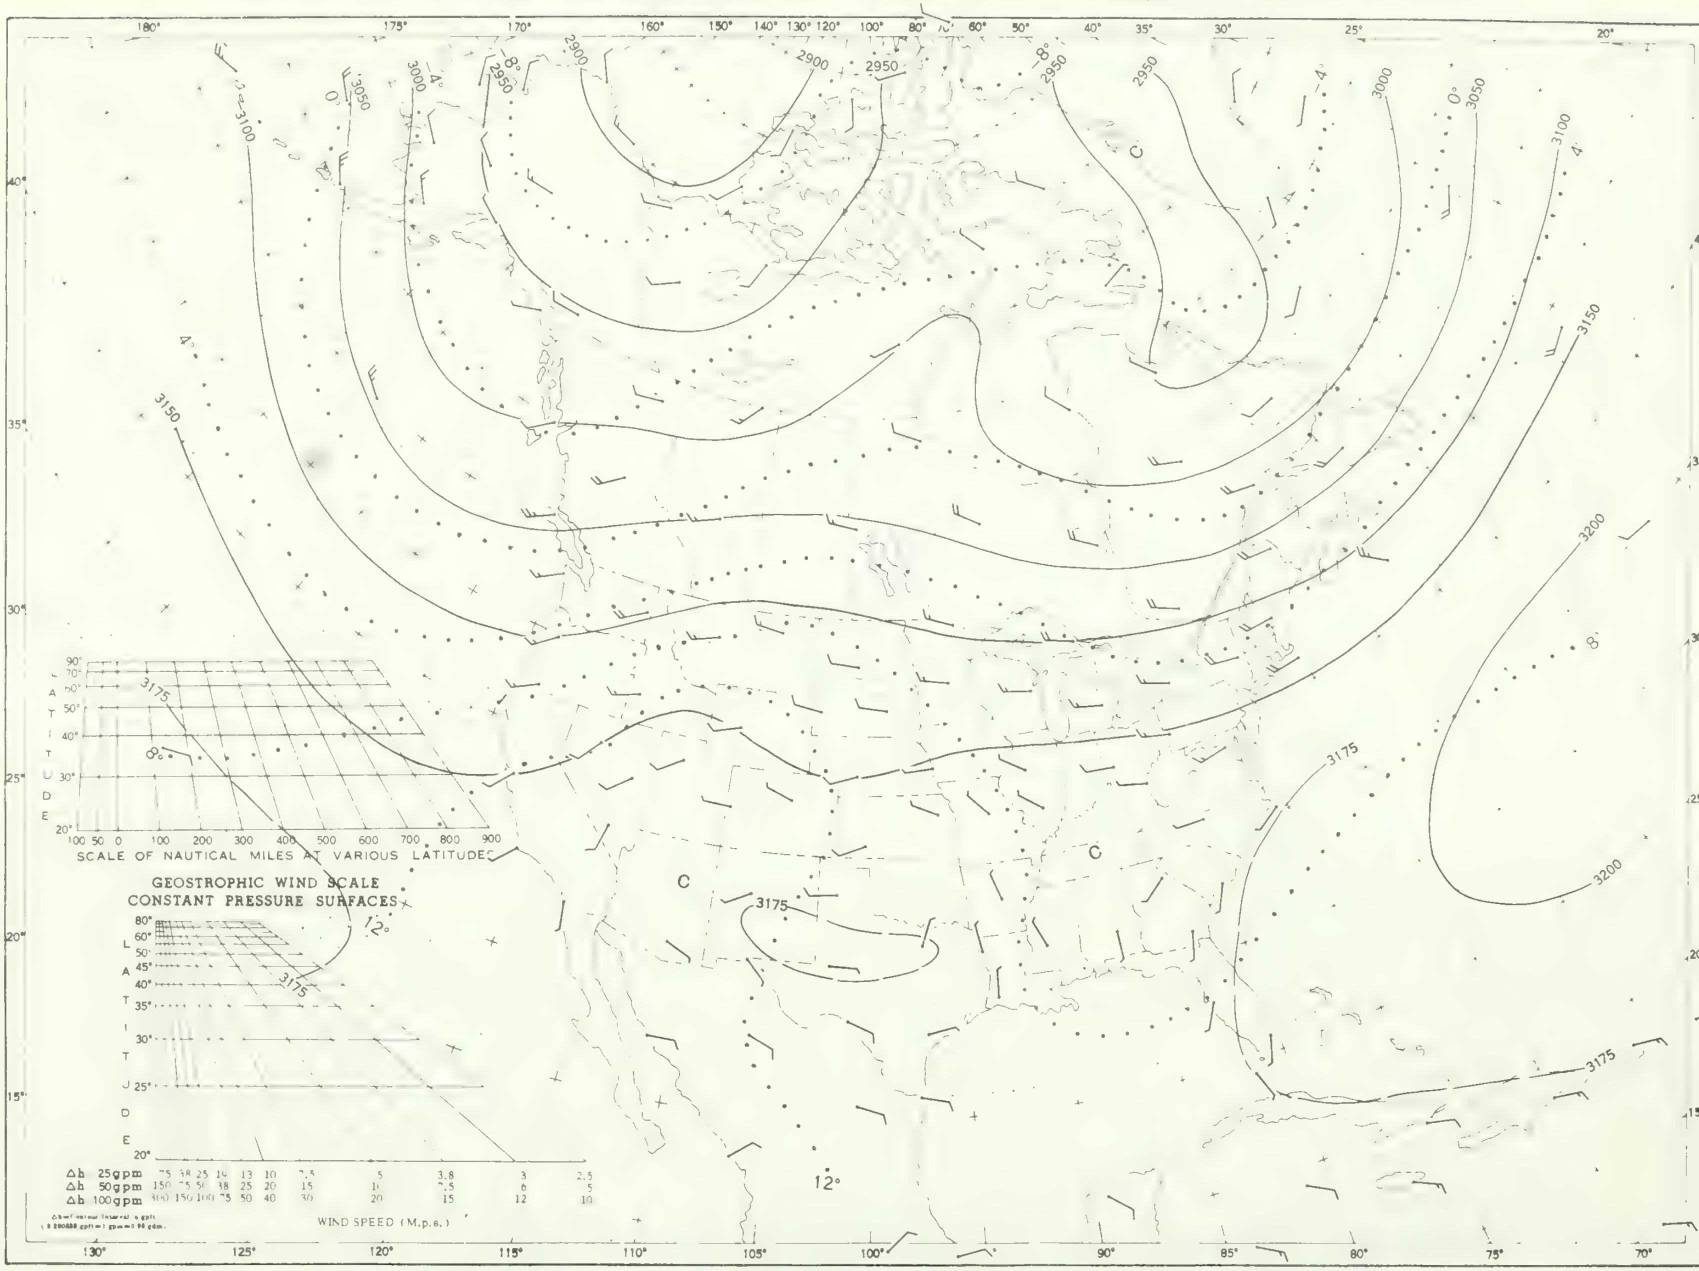
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10 intersections in a diamond grid over the oceans.

Chart XI 350-mb Surface, 1200 GMT, **August 1969**. Average Height and Temperature, and Resultant Winds.



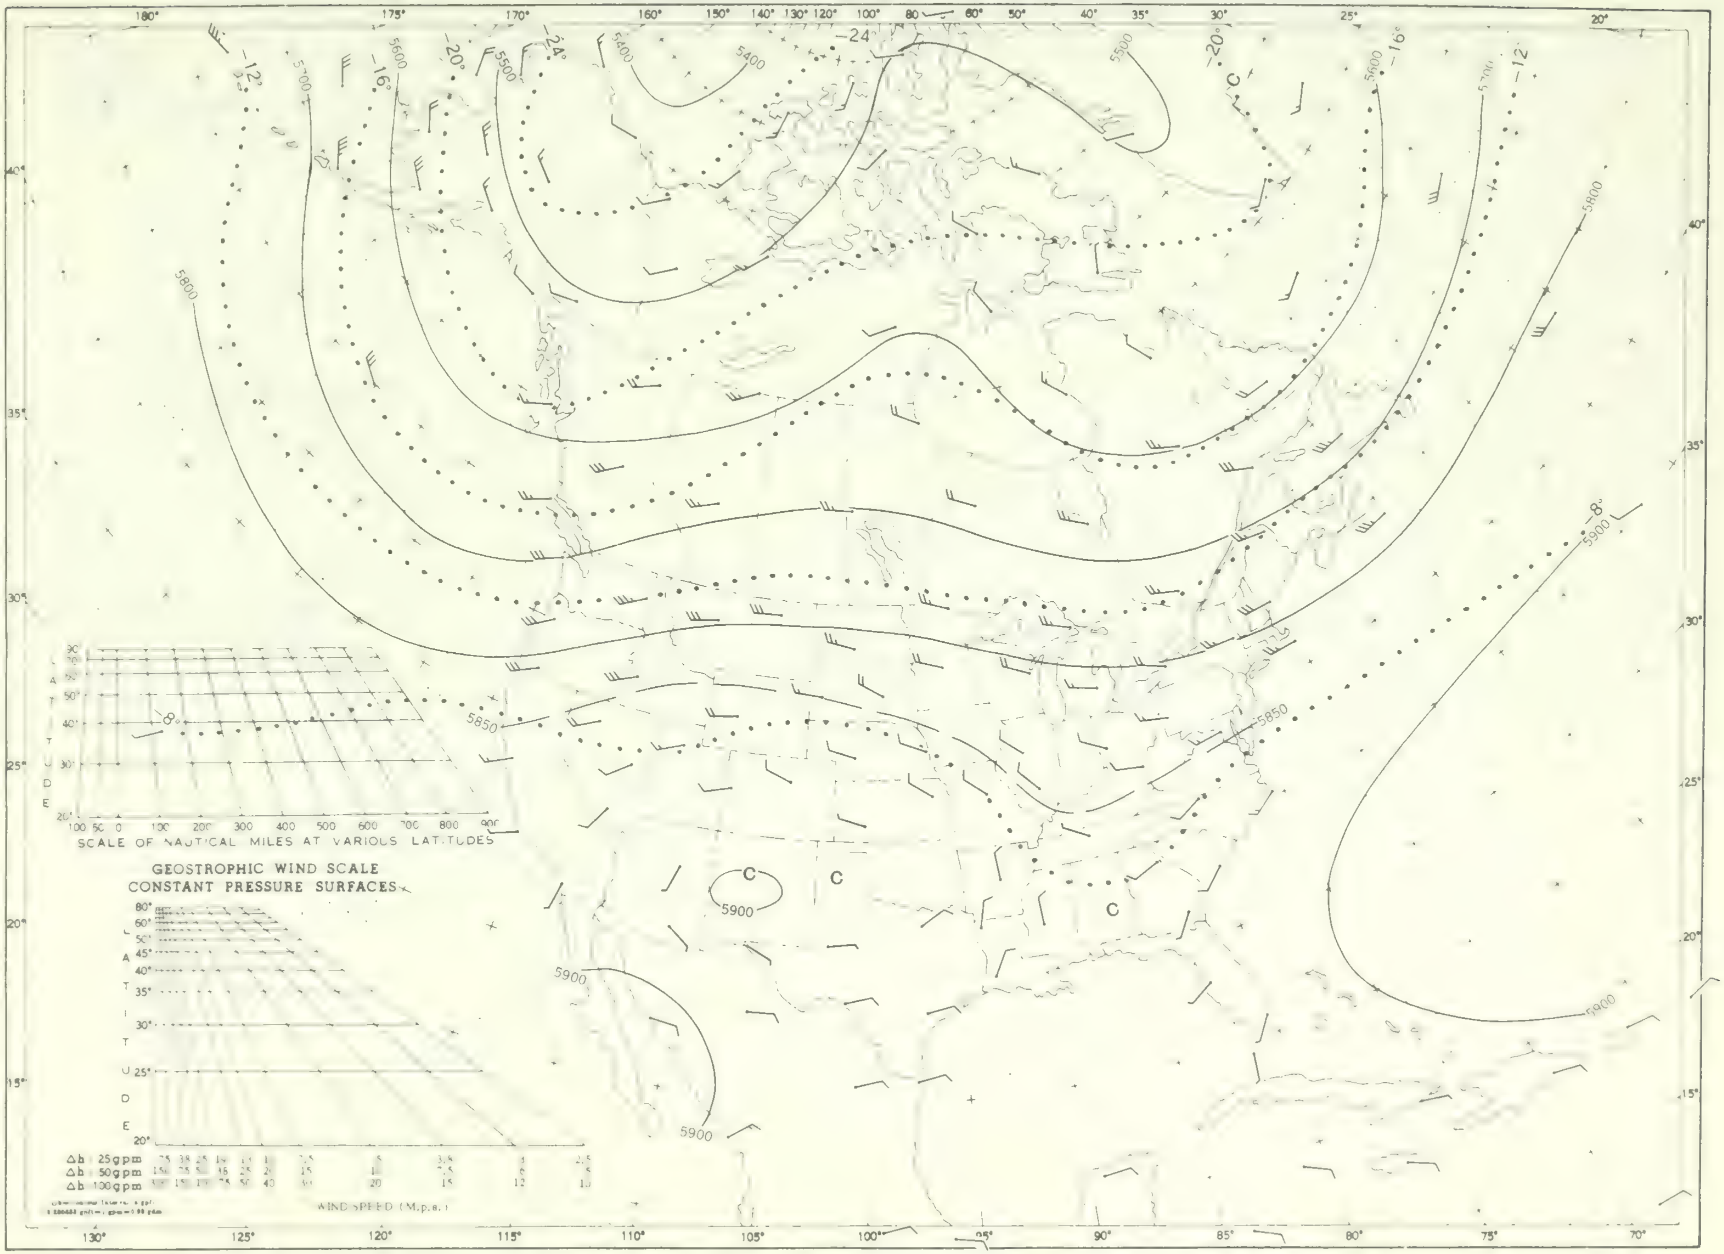
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 GMT, **August 1969**. Average Height and Temperature, and Resultant Winds



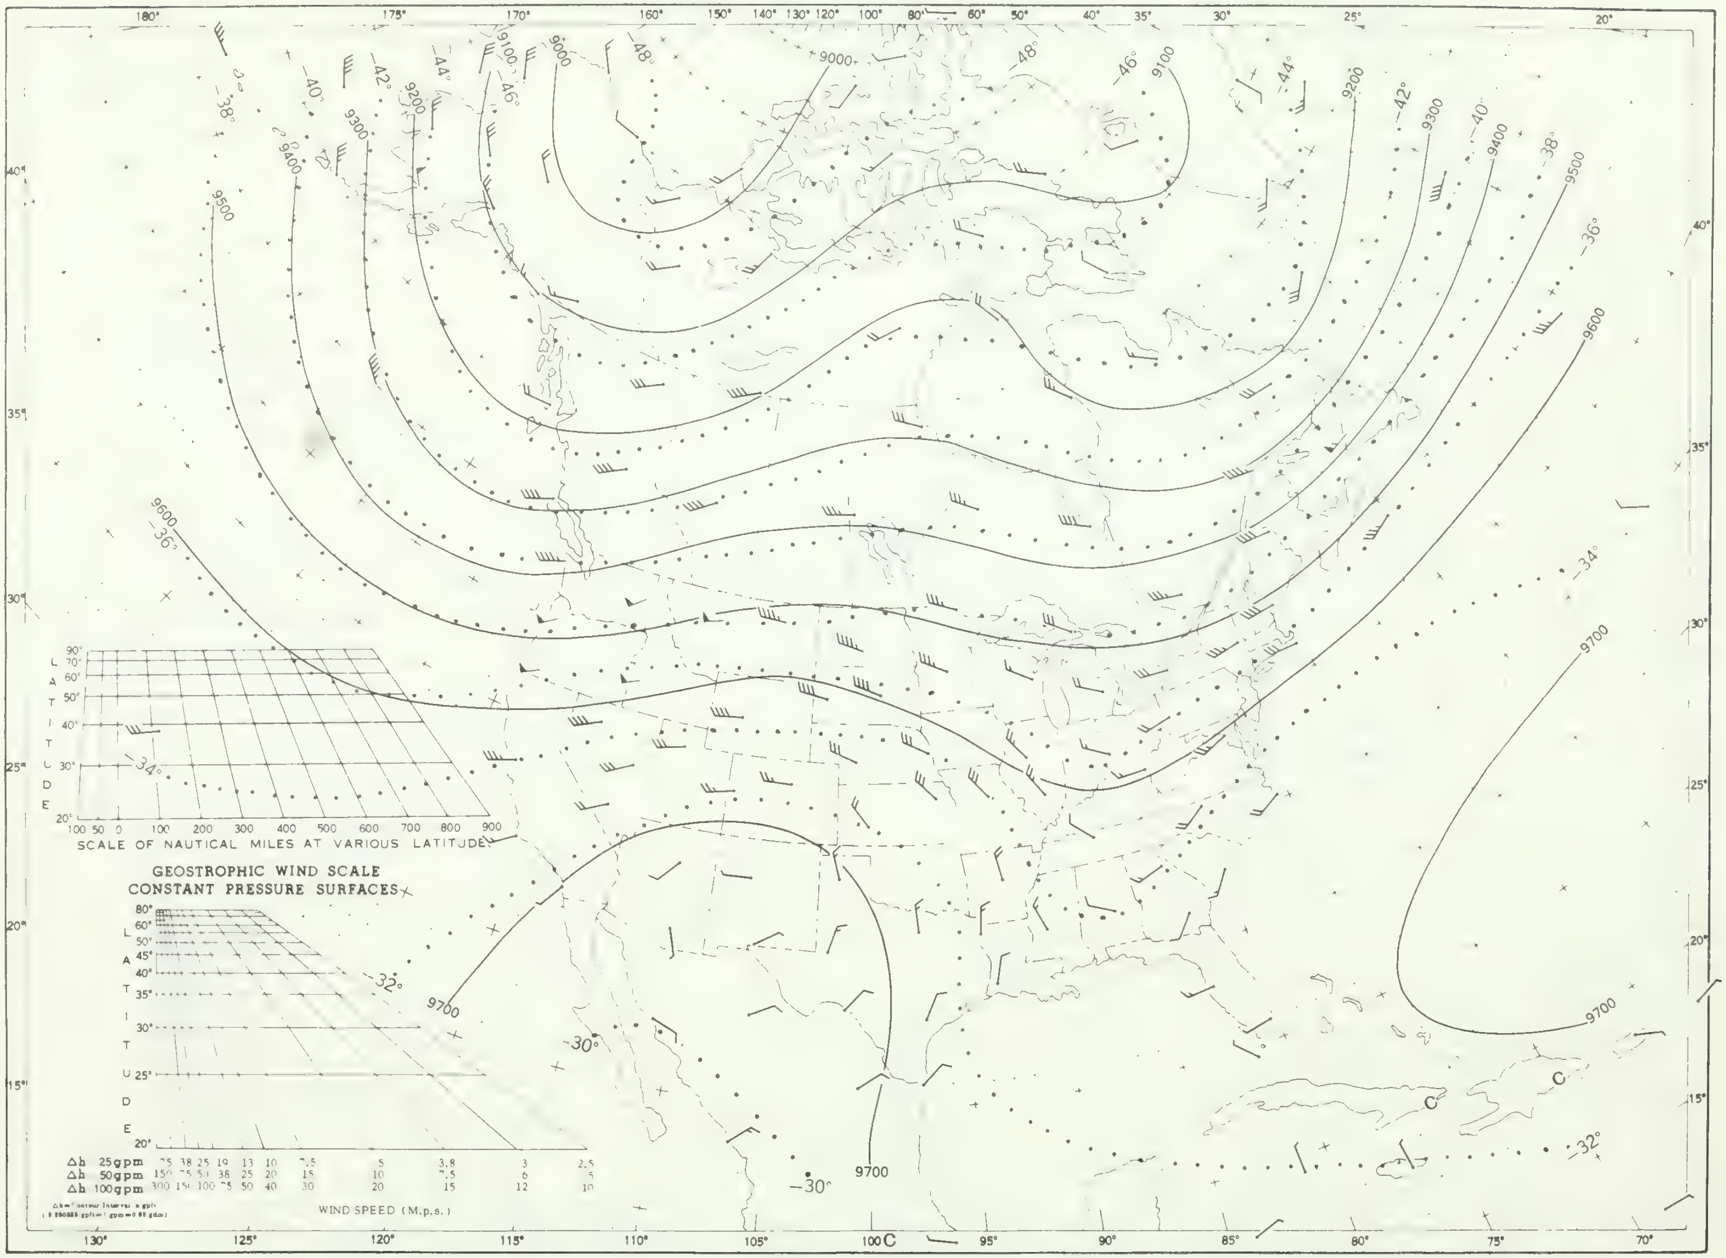
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII. 500-mb. Surface, 1200 GMT, **August 1969**. Average Height and Temperature, and Resultant Winds



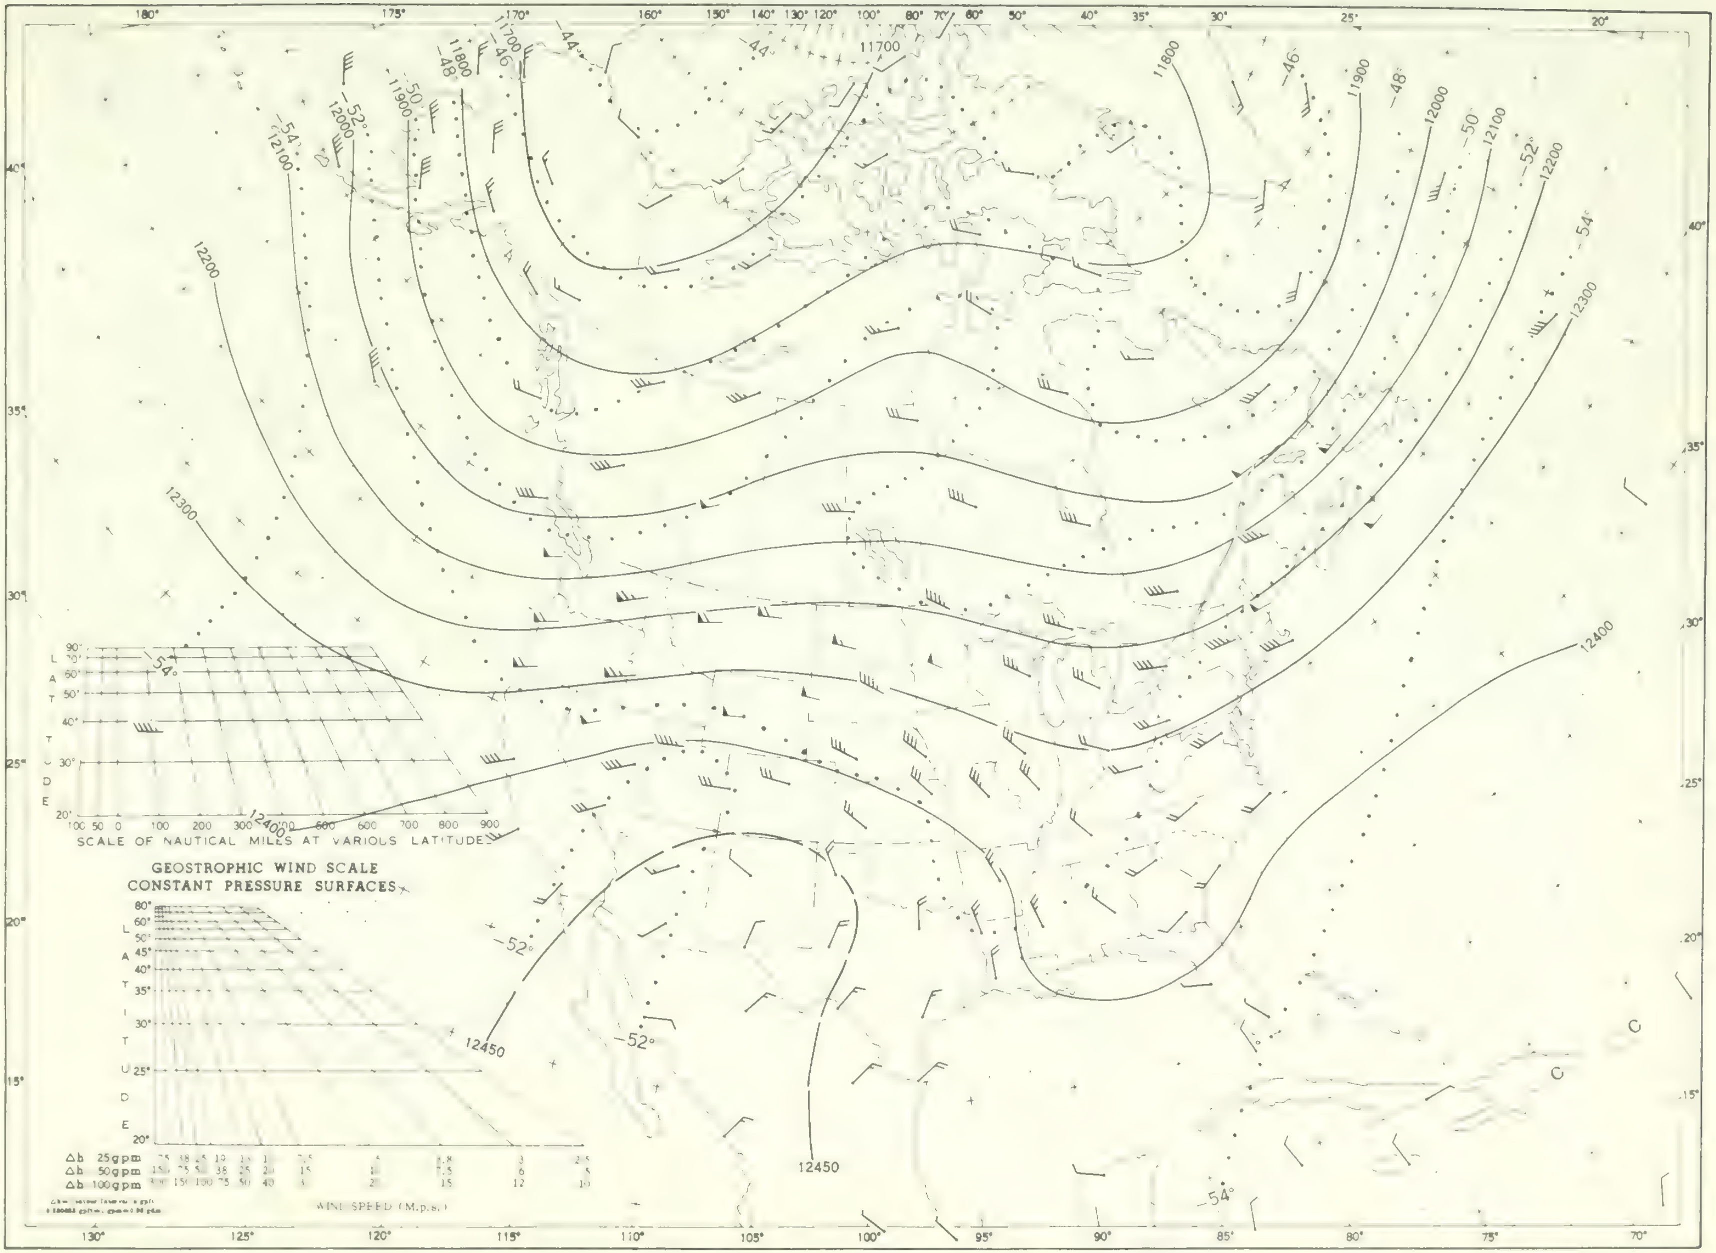
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV. 300-mb. Surface, 1200 GMT, August 1969. Average Height and Temperature, and Resultant Winds.



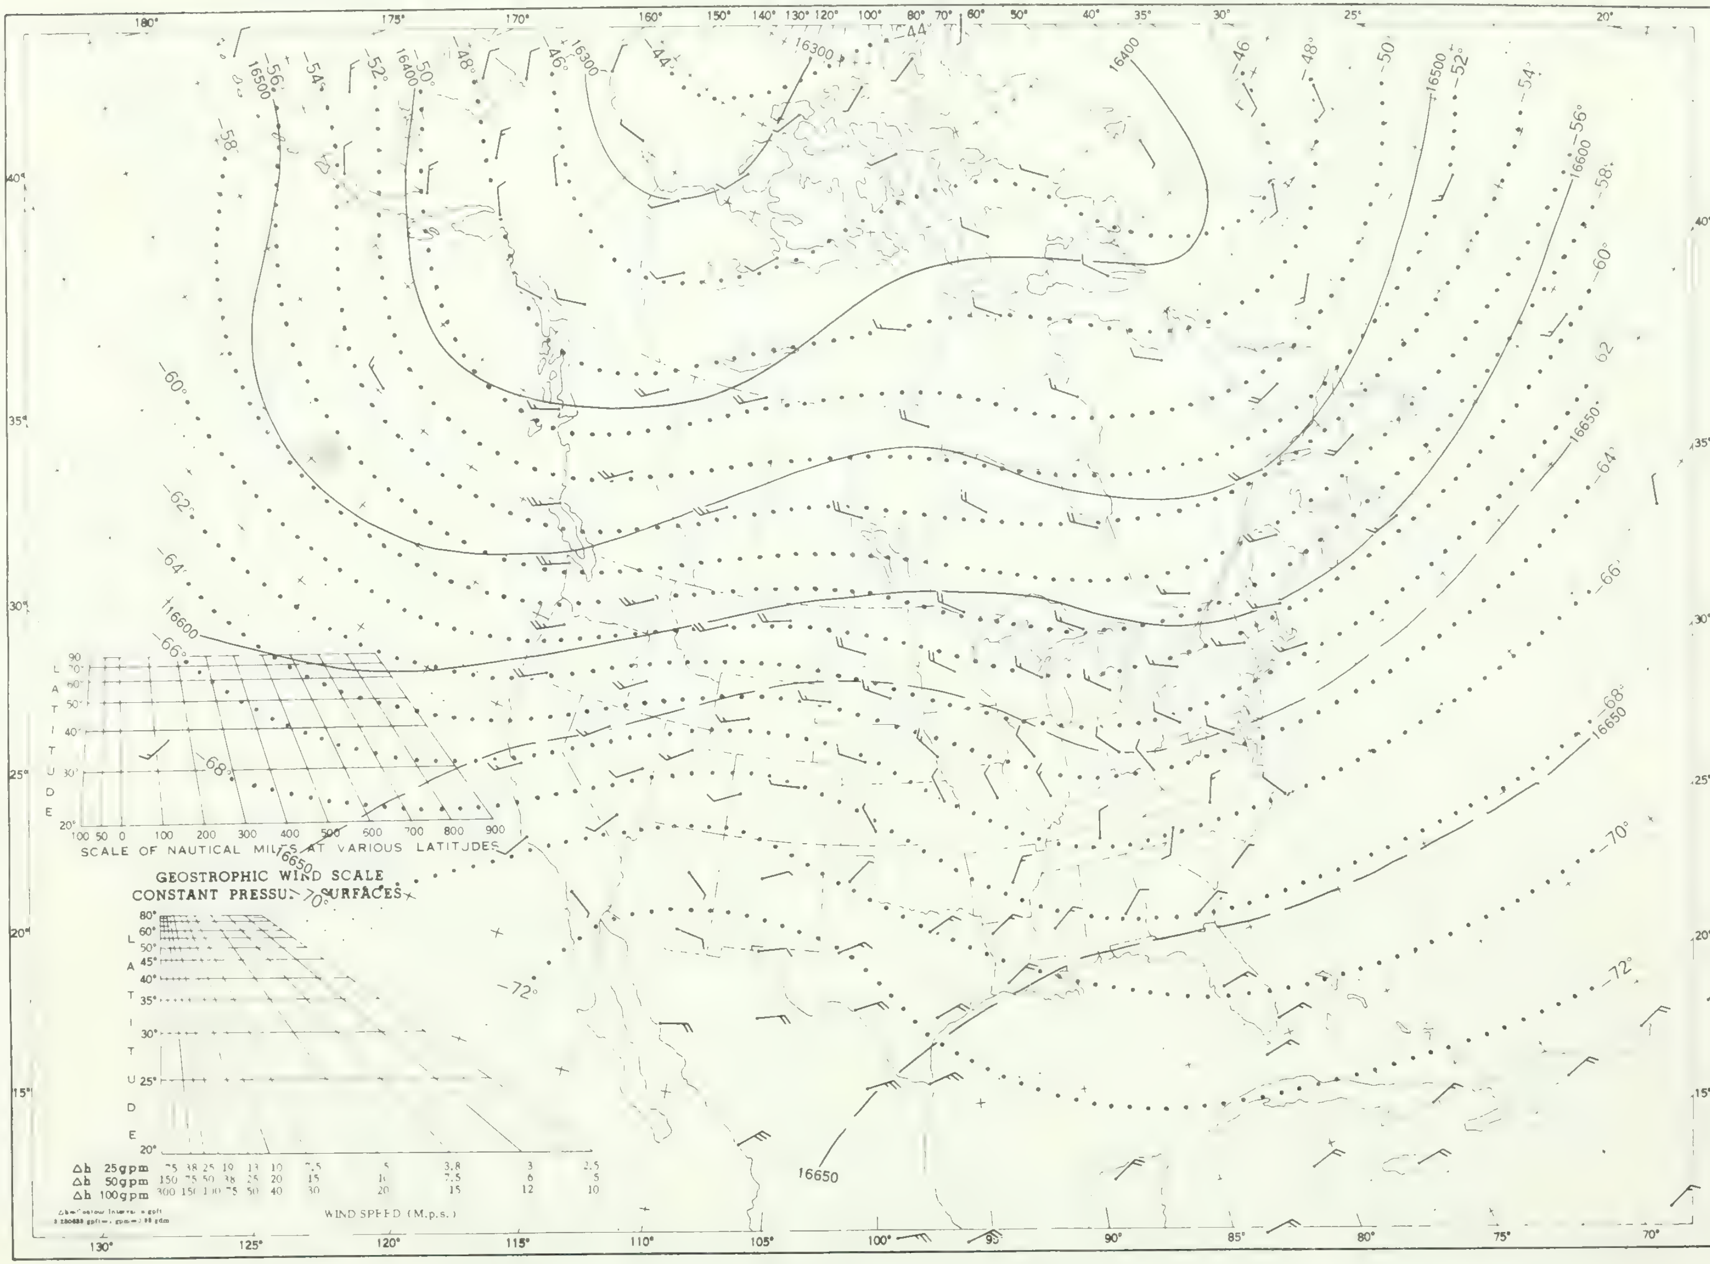
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV. 200-mb. Surface, 1200 GMT, August 1969. Average Height and Temperature, and Resultant Winds



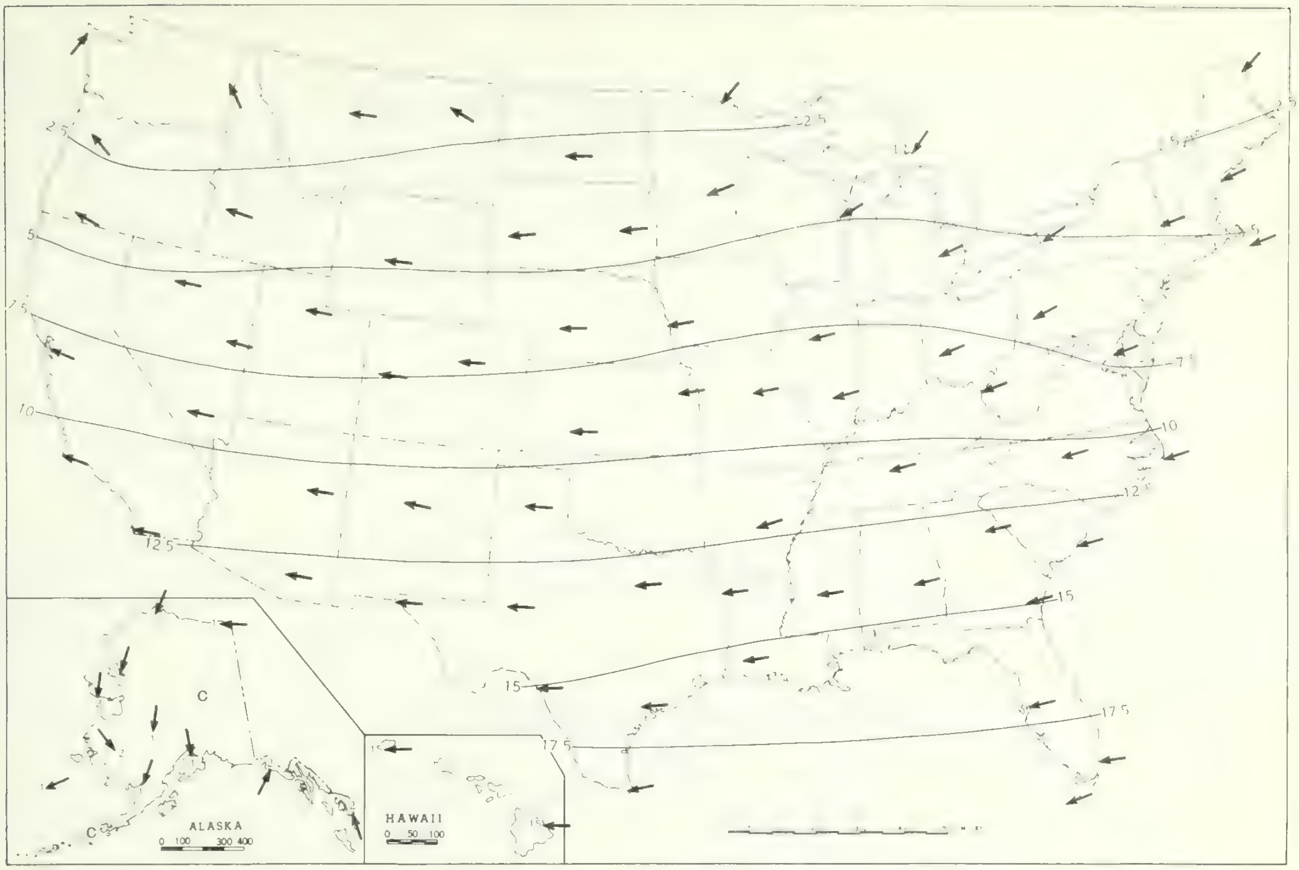
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI. 100-mb. Surface, 1200 GMT, August 1969. Average Height and Temperature, and Resultant Winds

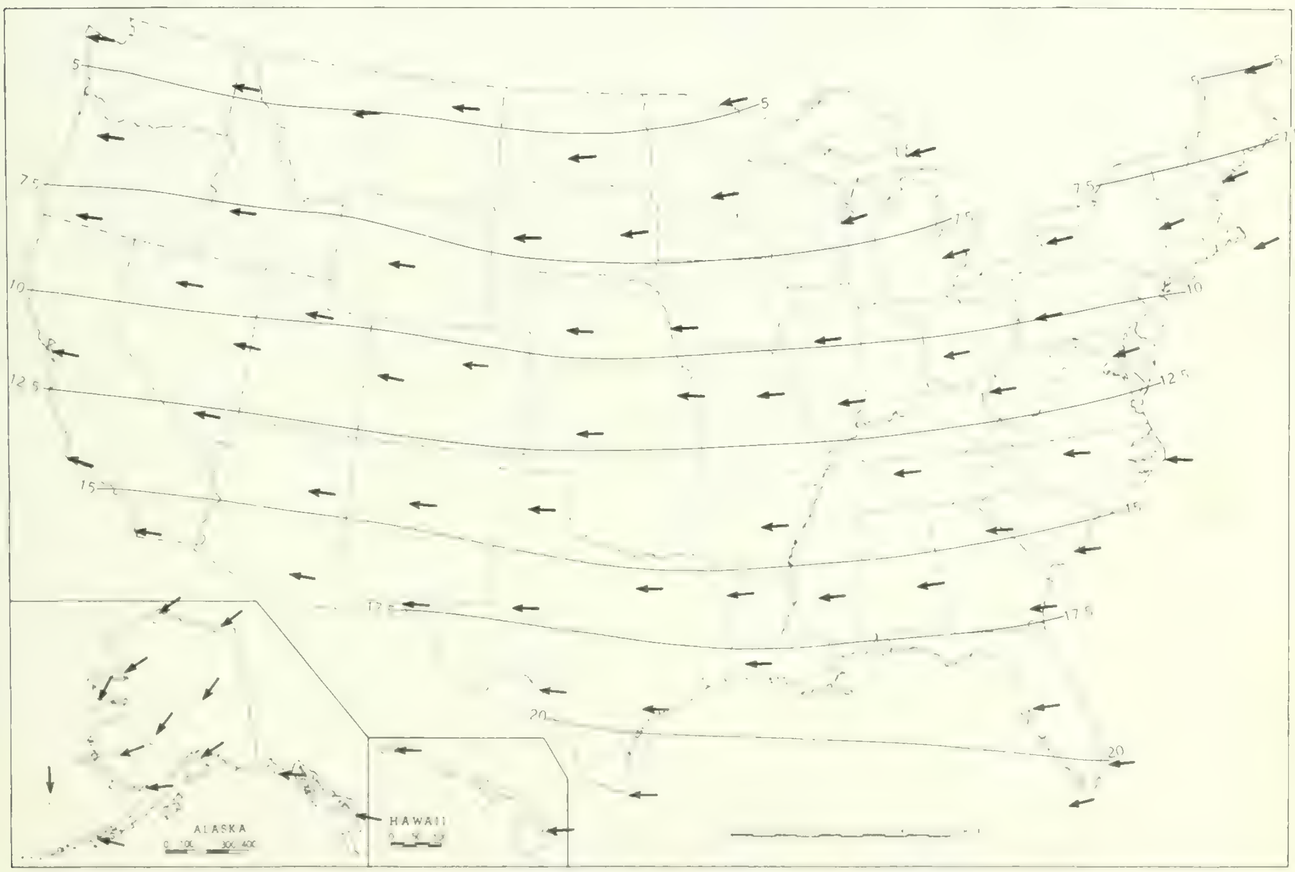


Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 GMT, August 1969. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, August 1969. Resultant Winds.



Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

NOTE: Delayed data and corrections will be carried in the June and December issues of this publication. An explanatory page "Description of Charts" will be carried in the January and July issues.

SUBSCRIPTION PRICE: Monthly 20 cents and annual 40 cents per copy; yearly subscription, including monthly and annual issues, $2.50 domestic, $3.50 foreign. Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to "Superintendent of Documents, Government Printing Office, Washington, D.C. 20402"

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 20 No. 9 SEPTEMBER 1969

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. In general, September was warm and dry over the West and North Central (except wet in the Far Northwest) and cool over the East.
2. Rainfall ranged widely in the East, from less than 1 inch in a few widely separated spots to over 8 inches in much of Florida. A few monthly totals approached 20 inches. Wewahitchka, Fla., received 22.21 inches.

TEMPERATURE.--September continued the warm-weather pattern over much of the western United States. Bakersfield, Calif., Casper, Wyo., and Salt Lake City, Utah, recorded the highest average temperatures for any September of record and at Bismarck, N. Dak., September 1969 was the warmest September since 1952. Red Bluff, Calif., reported that a stretch of 77 consecutive days with maximum temperatures 90° or higher ended on September 13 and Sacramento, Calif., registered 90° or higher on 18 days in September, the greatest number in 35 years.

Temperatures over parts of the Great Basin averaged 3° to 6° above normal. Over the West, the warm Weather prevailed throughout most of the month. The main exceptions were the 1st week when the Far Northwest was slightly cooler than most Septembers and the 3d week when the Pacific States were relatively cool. Temperatures in the southwestern deserts climbed to 110° or higher early in September. Thermal, Calif., registered 114° on the 2d. At the other extreme, subfreezing temperatures occurred in the higher valleys in the northern and central Rocky Mountains. Big Piney, Wyo., registered 17° on September 5. Southerly winds on the west side of a High carried warm moist air to the central and southern Rockies in the 2d week of September. The Far West cooled in the 3d week but warmed in the last week of the month.

Most of the East averaged cooler than normal. Temperatures over the southern Appalachians averaged 2° to 6° below normal. The East was warm the 1st week, but cool weather persisted the rest of the month except for some warming along the Gulf coast after midmonth. A series of fronts kept most of the East supplied with cool, fresh, dry air in the last half of the month.

PRECIPITATION.--Showers and thunderstorms covered the southeastern half of the United States in connection with a cold front that stretched from the Northeast to the Texas Panhandle and in the hot, humid air southeast of the front. Storm totals ranged widely from a fraction of an inch to about 4 inches, with a few totals approaching 6 inches. On September 3, a 6-inch rain, the largest 1-day total in the last quarter century, at New York City caused local flooding from Staten Island to Yonkers. The water flooded basements, highways, expressways, and low-lying areas. The high water hampered subway and rail traffic in the metropolitan area, and the reduced visibility during the rains halted air traffic at the major terminals.

The almost-daily showers continued along the Atlantic coast into the 2d week of September. Hurricane Gerda, moving northeastward off the northern Atlantic coast, dumped up to 4 inches along the coastal portions of New England, causing considerable washing and flooding in some areas.

Generous showers continued over parts of Texas through the first 3 weeks of September. Heavy downpours on the afternoon and evening of September 1 caused flooding and washing of highways in the El Paso area. Torrential rains on the 18th inundated streets and flooded about 400 homes and apartments in southwest Lubbock. Shortly after midmonth, heavy showers caused flash floods along some streams in Kansas, Oklahoma, Missouri, and Illinois.

Torrential rains from September 20 to 23 in northwestern Florida flooded low-lying areas and damaged roads and bridges. Crop damage was estimated at over $1/2 million and damage to real and personal property was judged to exceed $2 million.

Pacific storms moved into the Far Northwest about mid-September, with the cloudy, rainy weather continuing to the end of the month with a few monthly totals exceeding 10 inches. Seattle, Wash., received 5 1/2 inches in the month, setting a new record for September. Salem, Ore., also set a new record with 3.58 inches. A station northeast of Aberdeen, Wash., received 14.81 inches for a monthly total.

Many areas in the West were quite dry. One dry area, extending from California to the northern Great Plains, received less than 1 inch of rain. Most of California and Nevada received less than 50% of their normal rainfall in the 3-month period, July to September.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70°F. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

CLIMATOLOGICAL DATA

METRIC UNITS

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

See footnotes at end of table

° Includes crop damage
C Crop damage

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
\# Freezing drizzle and freezing rain, commonly known as glaze.
∅ For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, ESSA, monthly publication STORM DATA.

† Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

SEPTEMBER 1969

Elmer R. Nelson, Office of Hydrology

The most damaging floods during September occurred in northwest Florida. Severe flooding occurred in Leon, Gadsden, and Liberty Counties with damage in Gadsden County estimated at $2.8 million. The Ochlockonee River exceeded or equaled the Dec. 1964 flood.

ATLANTIC SLOPE DRAINAGE

Heavy rains in central New Jersey during the 24-hour period ending at 7 a.m. on Sept. 4 caused overflow of small headwater streams and local flooding in areas of poor drainage. The heaviest rains were in east-central New Jersey between the Raritan and Passaic Rivers where rainfall amounts ranged from 4 to 5 inches. The Millstone River at Blackwells Mills, N. J., crested 0.8 foot above flood stage on the 4th and receded within its banks on the 5th. The Assunpink Creek at Trenton, N. J., crested 0.5 foot above flood stage on the 4th. Flooding impeded traffic on the New Jersey turnpike between Woodbridge and Carteret, N. J., where police lowered the speed limit from 60 m.p.h. to 45 m.p.h. Police had to use pumps to keep the roadway free between Exit 14 at Newark Airport and Exit 15 at Raymond Boulevard.

Heavy rain on the 17-20th caused minor flooding on the lower Cape Fear River on the 22-23d. The rainfall ranged from 4 to 6 inches in the middle portion of the basin. No damages were reported.

Rain showers during the first week in the month caused a 4-foot overflow on the Broad River at Blair, S. C., on the 5-6th. Damage was minor. The Coosawhatchie River flooded lowlands and swampland from near Hampton, S. C., to the coast. Highway 17 was flooded and closed to traffic on the 4-9th. The fill at both ends of the bridge near Coosawhatchie 9 miles north of Ridgeland, S. C., was damaged.

Flash flooding occurred on the Reedy River at Greenville, S. C., on the 19th. Rainfall totaled 4.36 inches in Greenville in less than 3 hours from 1 a.m. to 4 a.m. The river rose rapidly out of its banks and occupants of a few homes had to be evacuated by boat. Considerable flooding occurred in the Berea area adjacent to Greenville. The building housing the Brookline Carpet, Inc., was flooded causing over $100,000 damage to heavy machinery and yarn. The Lumber River at Lumberton, N. C., reached flood stage on the 25th and continued in flood the remainder of the month. Only minor damage resulted from the 2.5-foot overflow.

Light flooding occurred on the Ogeechee River from the vicinity of Dover, Ga., downstream during the early part of September. It is estimated that flood stage at Eden, Ga., was not exceeded by more than 1.5 ft. Damage, if any, was light.

Minor flooding occurred on the Satilla River near Atkinson, Ga., on the 3d-7th. No damage was reported from the light overflow.

EAST GULF OF MEXICO DRAINAGE

Heavy rains on the 20th-23d caused minor flooding on the Apalachicola River and severe flooding on the Ochlockonee River in Florida. The heavy rains were associated with a weak tropical depression that moved onto the northwest Florida coast during the night of the 20th-21st. A record 24-hour rainfall total of 13.66 inches was reported at Quincy, Fla., exceeding the previous record of 12.93 inches established in 1924. The total storm rainfall for Quincy was 17.4 inches, and for Havana, Fla., 23.72 inches.

The Ochlockonee River near Havana, Fla., equaled the Dec. 1964 crest of 30 feet on Sept. 22. At Bloxham, Fla., the river exceeded the 1964 flood by about 5 feet. The Little River near Quincy, Fla., exceeded the 1964 flood by about 4 feet, reaching a crest of 24.6 ft. on the 22d. Severe flooding occurred in Leon, Gadsen, and Liberty Counties where the storm rainfall ranged from 10 to 23.5 inches. Many secondary roads were under water in low-lying areas. State Road 20 and US 90 leading west from Tallahassee were closed early on the morning of the 22d. The estimated flood damage in Gadsden County was $2.8 million. Damage estimates for Leon and Liberty Counties and the Ochlockonee Basin are not yet available. Flood losses on the Apalachicola River near Blountstown, Fla., were negligible since the crest was less than 0.5 foot above flood stage.

MISSISSIPPI SYSTEM

Missouri Basin.--The record flooding which developed in the headwaters of the Little Blue River near Deweese, Nebr., on Aug. 31 receded within its banks on Sept. 2. The record crest of 17.07 ft. on Aug. 31 was 1.1 ft. higher than the previous record crest of 15.99 ft. on May 22, 1965. Downstream at Hebron, Nebr., residents reported the highest water levels in 40 years. Extensive overflow occurred near Fairbury, Nebr., on Sept. 3-4. The river reached, but did not exceed, bankfull stage near Hebron, Kans., on Sept. 4.

There were two periods of flooding on the Grand River in Missouri. The first rise was due to heavy rain (3 inches or more) on the night of the 6-7th. The crests ranged from 2.5 to 4.2 ft. above flood stage, except less than 1 foot above flood stage at Gallatin, Mo. The second rise was due to heavy rain on the 22d-23d. Pattonsburg and Chillicothe, Mo., reported over 4 inches of rain during that period. The only flooding reported was in the Chillicothe-Sumner, Mo., reach.

Moderate to heavy rains in west-central Missouri on the 15-16th produced local flooding on the Blackwater River on the 15th-21st and on the Lamine River at Clifton City, Mo., on the 16-18th. The crests on the Blackwater River at Valley City, Mo., were 8 ft. above flood stage on the 17th and at Blue Lick, Mo., 2.6 ft. above flood stage. The Lamine River at Clifton City, Mo., crested 9 ft. above flood stage on the 17th.

Minor lowland flooding occurred briefly on the 17th on the Smoky Hill River near Sharon Springs and south of Wallace in west-central Kansas. Pottawatomie Creek at Garnett, Kans., crested 0.5 foot above flood stage on the 17th. Light overflows occurred locally in the Marais des Cygnes Basin at Midmonth. The total flood damages in the Little Blue River basin in Nebraska during August and September were estimated at $1.3 million. Flood losses in the Marais des Cygnes and Smoky Hill River basins were negligible.

Minor flooding occurred on the South Grand River at Urich and Brownington, Mo., between the 17th and 23d. The Osage River at Schell City, Mo., was out of its banks on the 17th-22d. No flood damage of any consequence resulted.

Ohio Basin.--A flash flood occurred on Spring Creek, a tributary of Greenbrier River, during the night of the 5-6th. According to reports the water was about a foot higher than that produced by Hurricane Camille in August 1969. This flooding was due to locally intense rainfall in the mountainous area on Spring Creek during

the evening and early night of the 5th. Renick, W. Va., a few miles south of Spring Creek, reported 2.1 inches of rainfall and Jacox Knob, W. Va., a few miles northeast reported 2.99 inches. The highest official amount reported was 3.55 inches at Richwood, W. Va., (10 to 15 miles north of Spring Creek). There were rumors and unofficial reports of 10 to 15 inches in the area. The corn crop and meadows were washed flat (1,254 acres). The stream channel changed its course in many locations. Some of the land was damaged beyond economic repair. Bridges and roads were washed out. Three houses were washed away and 12 damaged. The total damages near Renick, W. Va., were estimated at $281,200.

Arkansas Basin.--Heavy rain on the 1st and 2d caused minor flooding on the South Fork Ninnescah River near Murdock, Kans., and on the Canadian River at Amarillo, Tex., on the 2d and 3d. Rainfall amounts totaled as much as 5.12 inches during the 48-hour period at Pratt, Kans.

Heavy rain on the morning of the 15th produced moderate flooding on the Little Arkansas River at Sedgwick, Kans., on the 16-17th. The total flood damages were estimated at $150,000.

Brief flash flooding was reported in Oklahoma on the 16-17th near Bartlesville, Nowata, Barnsdall, Pawhuska, Blackwell, and Garber. The heavy storm of the 16-17th produced adequate runoff in northeastern Oklahoma to cause streams to run three-quarters bankfull. The Little Caney River near Copan, Okla., crested 2.4 ft. below bankfull stage on the 17th.

Red Basin.--Thunderstorms with heavy rain over north-central Texas and southwestern Oklahoma on the 21st and on the night of the 22d caused rapid rises on creeks and some mainstem flooding of the Red River near Burkburnett, Tex. Beaver Creek at Electra, Tex., was out of its banks on the 22-23d and crested 2.4 ft. above flood stage on the afternoon of the 22d. Flash flooding occurred on Deep Red Run in Tillman and Cotton Counties in Oklahoma on the 22d. Some 400 head of cattle were reported killed, with damage to many acres of small grains and cotton. Some levees were destroyed and roads near Chattanooga, Okla., were damaged. Several cars were submerged with some occupants trapped in trees until rescued. A few homes in Tillman County were swept away.

GULF OF CALIFORNIA DRAINAGE

Colorado Basin.--Local flash flooding occurred east of Yuma, Ariz., on the 6th and on Clear Creek 20 miles south of Winslow, Ariz., on the 11th. US Highway 95 and other roads were closed in the Parker-Ehrenburg, Ariz., area in northern Yuma County on the 13-14th. Local flooding was heavy in the Tempe-Guadalupe, Ariz., area on the 14th. Local flooding occurred in the Tempe-South Phoenix, Ariz., area on the 16th.

A minor flood occurred on the 2d on Potters Wash in the San Rafael drainage, Emery County, Utah. A heavy shower on the 9th caused some overflow along the Muddy River just east of Utah Highway No. 10. Some damage resulted to irrigation systems along the Huntington Creek tributary.

Note: All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

\+ Observations for these stations are scheduled at 0000 G.C.T.

† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the surface and higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun. SEPTEMBER 1969

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

Note.--Langley is the unit used to denote one gram calorie per square centimeter. Values with an asterisk are interpolated.

U Indicates Urban sites.

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a.m.) at Palmer, Alaska

SEPTEMBER 1969

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	91	144	97	27	53	89	130	72	14	40	7	47	67	77	70	21	79	77	52	17	19	36	60	75	16	19	8	-34	-11	-11		51

The measurement is made with a CSIRO FUNK **net exchange radiometer over a plot of** sod. **The value represents the total incoming minus the total outgoing radiation of all wave lengths.**

These data are of an experimental nature and are published as received from the Palmer Exp. Station. **The instrument with which they were measured has not been checked by the** ESSA, Weather Bureau.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (< 3900 Å) at Ames, Iowa

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	19.29	15.27	16.81	12.55	13.97	10.30	17.99	16.93	17.64	9.94	16.33	16.10	14.56	11.60	9.82	8.99	14.44	6.98	14.80	15.15	12.78	6.15	13.61	15.74	13.26	11.24	14.08	13.19	12.66	12.19		13.18

These data are from an U - V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the ESSA, Weather Bureau.

TOTAL OZONE DATA

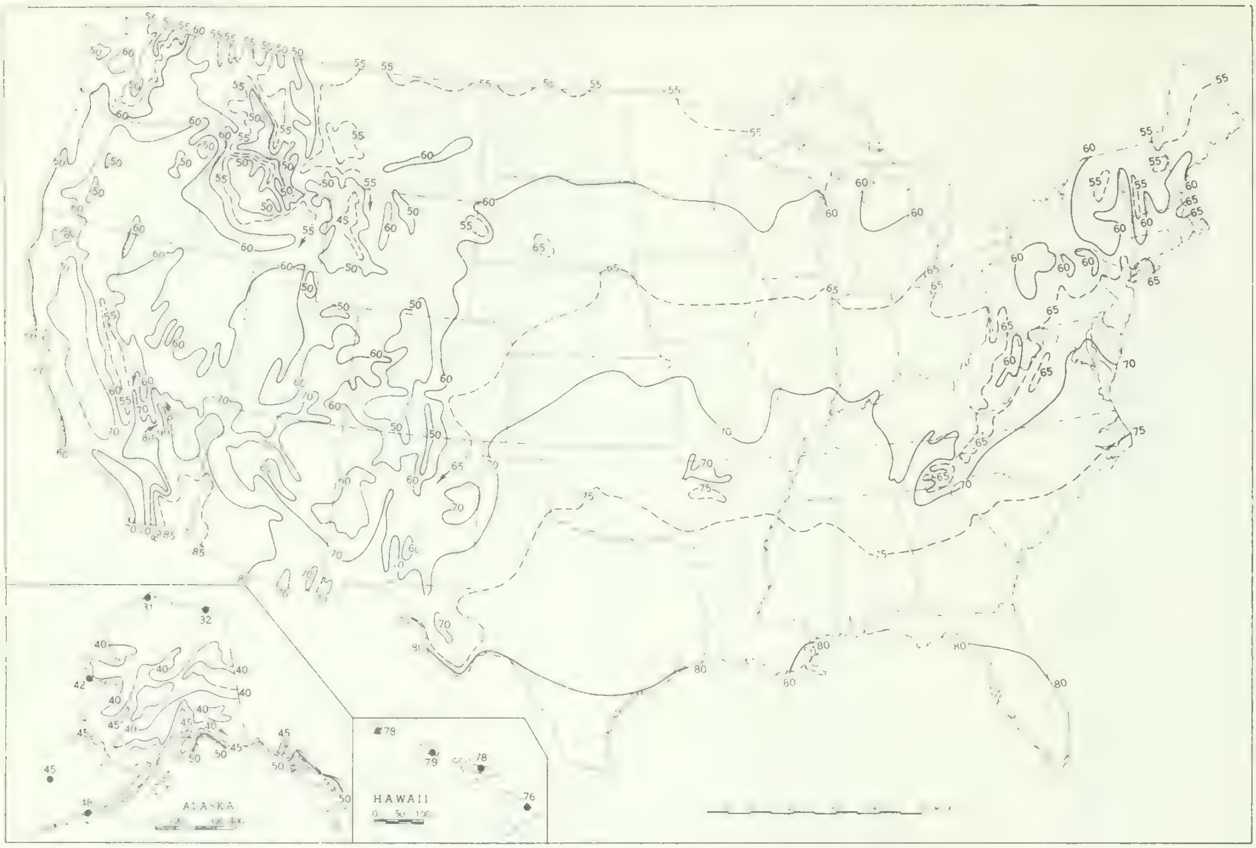
These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code [illegible] defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units Milli-atmo-cms.

Station	Day of month																															
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O_3
	Data will be delayed																															

The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column [illegible] is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., [illegible] atmo-cm ozone implies an ozone layer of [illegible] centimeter thick. The code [illegible] designates the type of measurement made.

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), September.



B. Temperature Departure from 30 - Year Mean (°F 1931-60), September 1969.

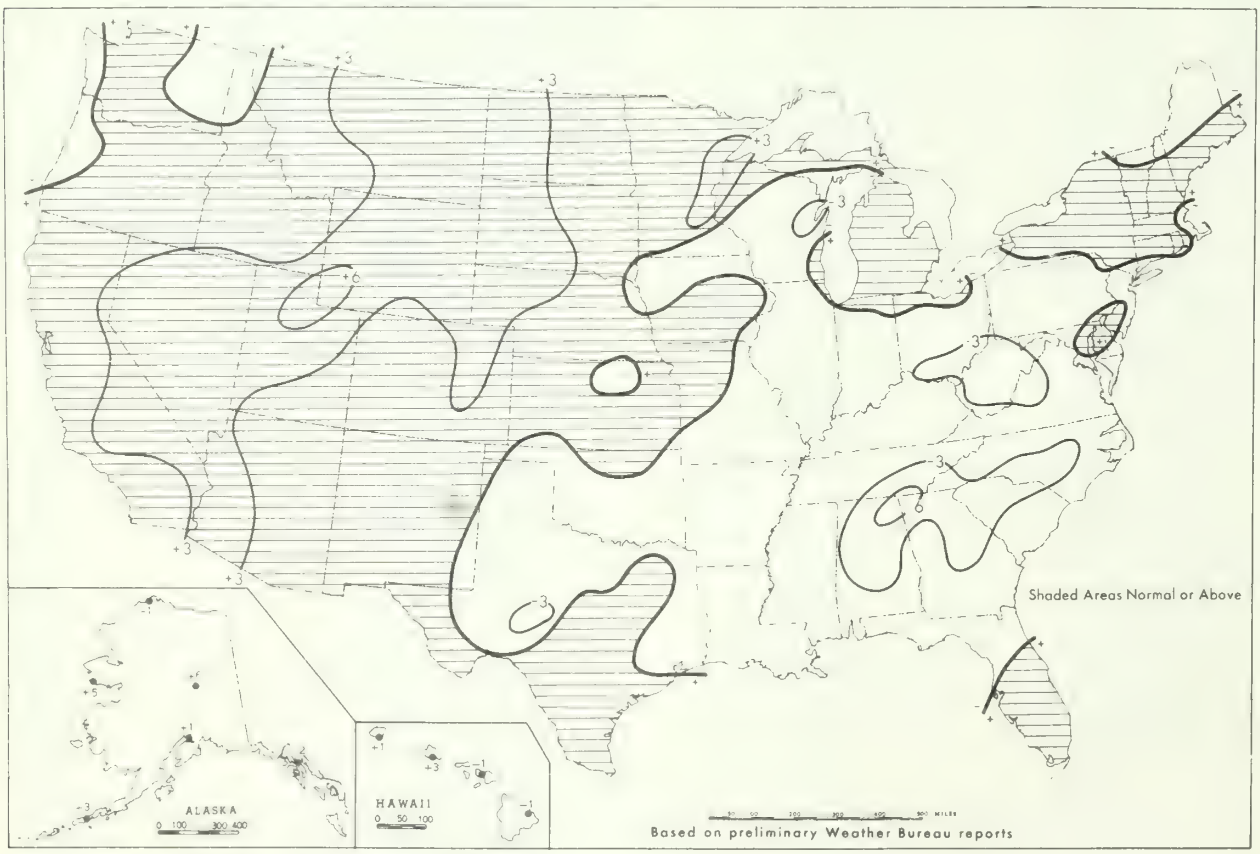


Chart II. Total Precipitation (Inches), September 1969.

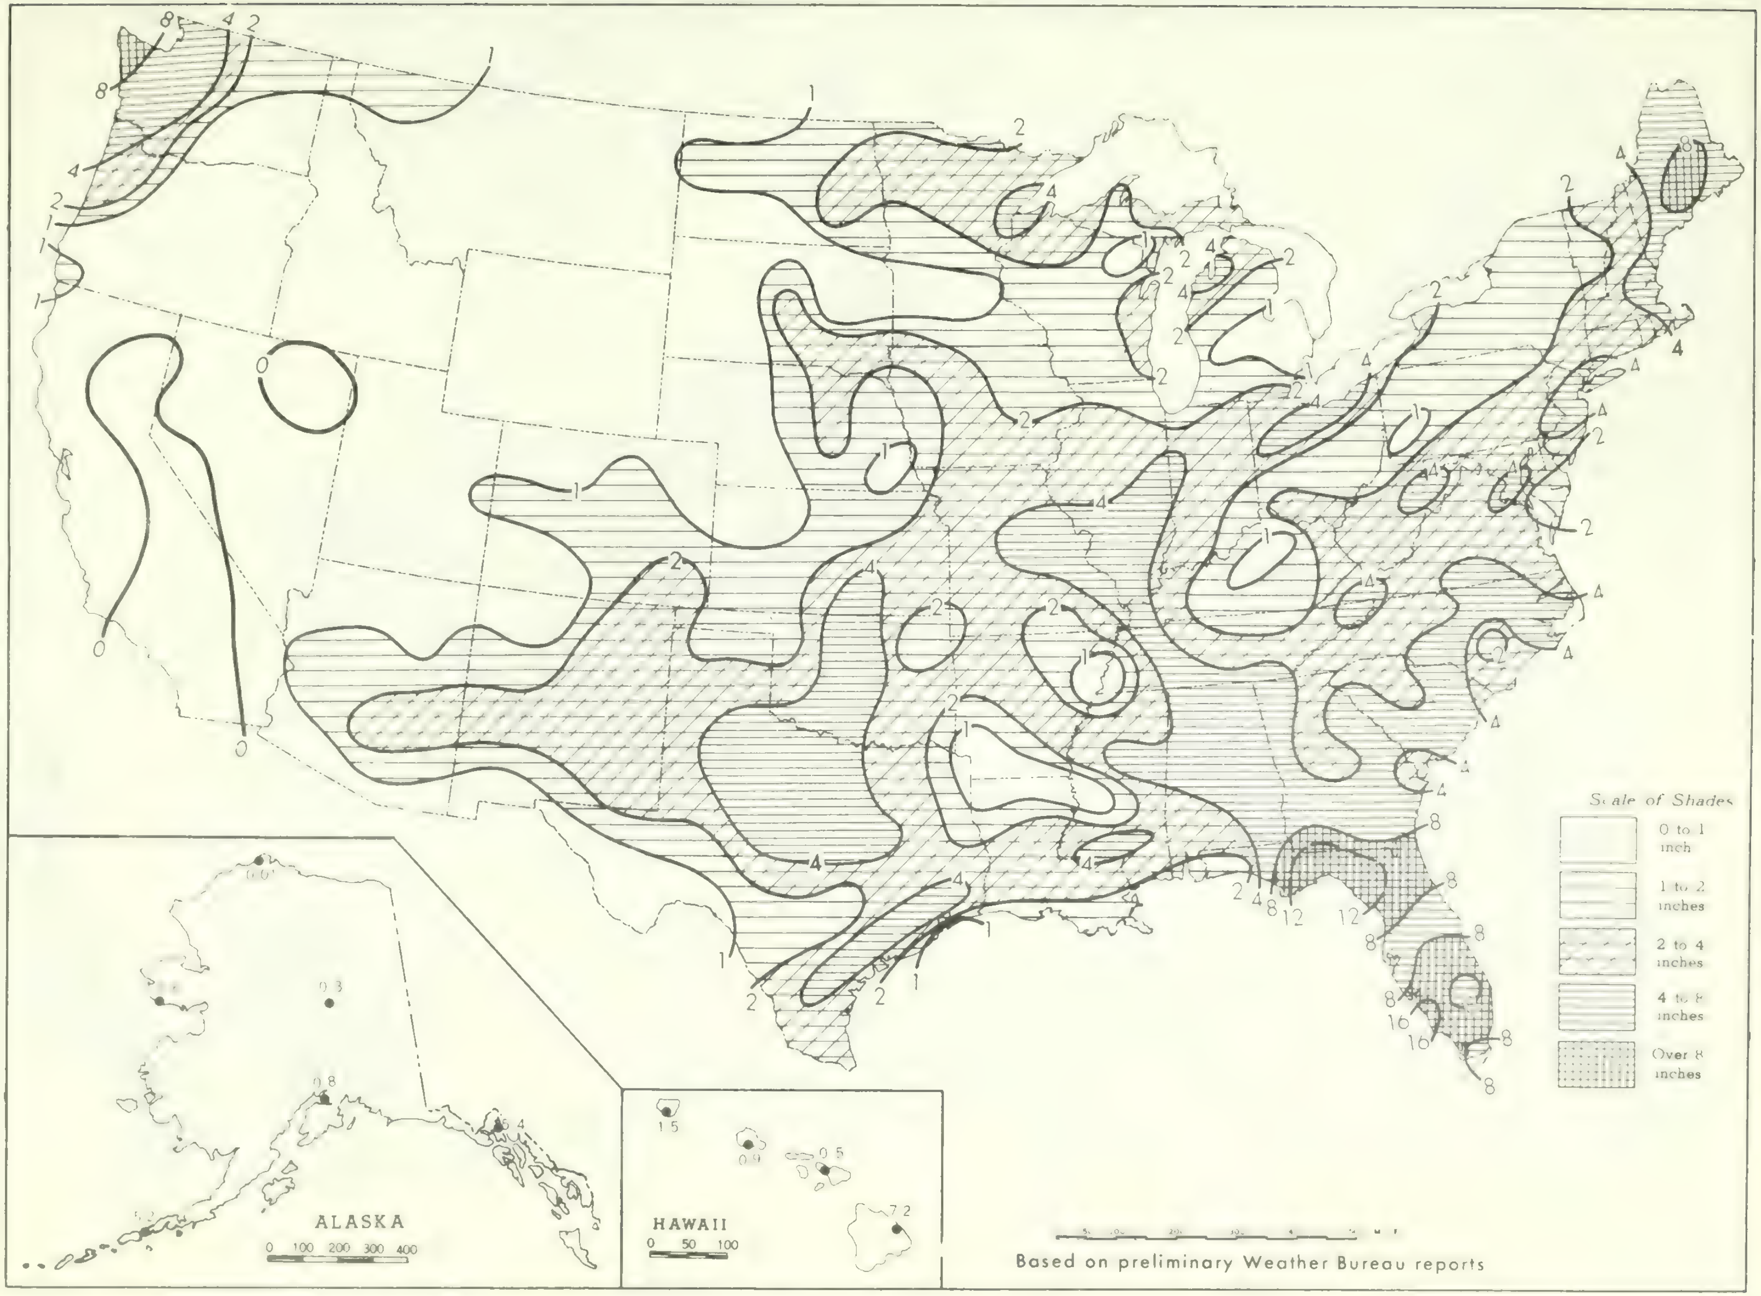

Chart III. Percentage of Normal Precipitation, September 1969.

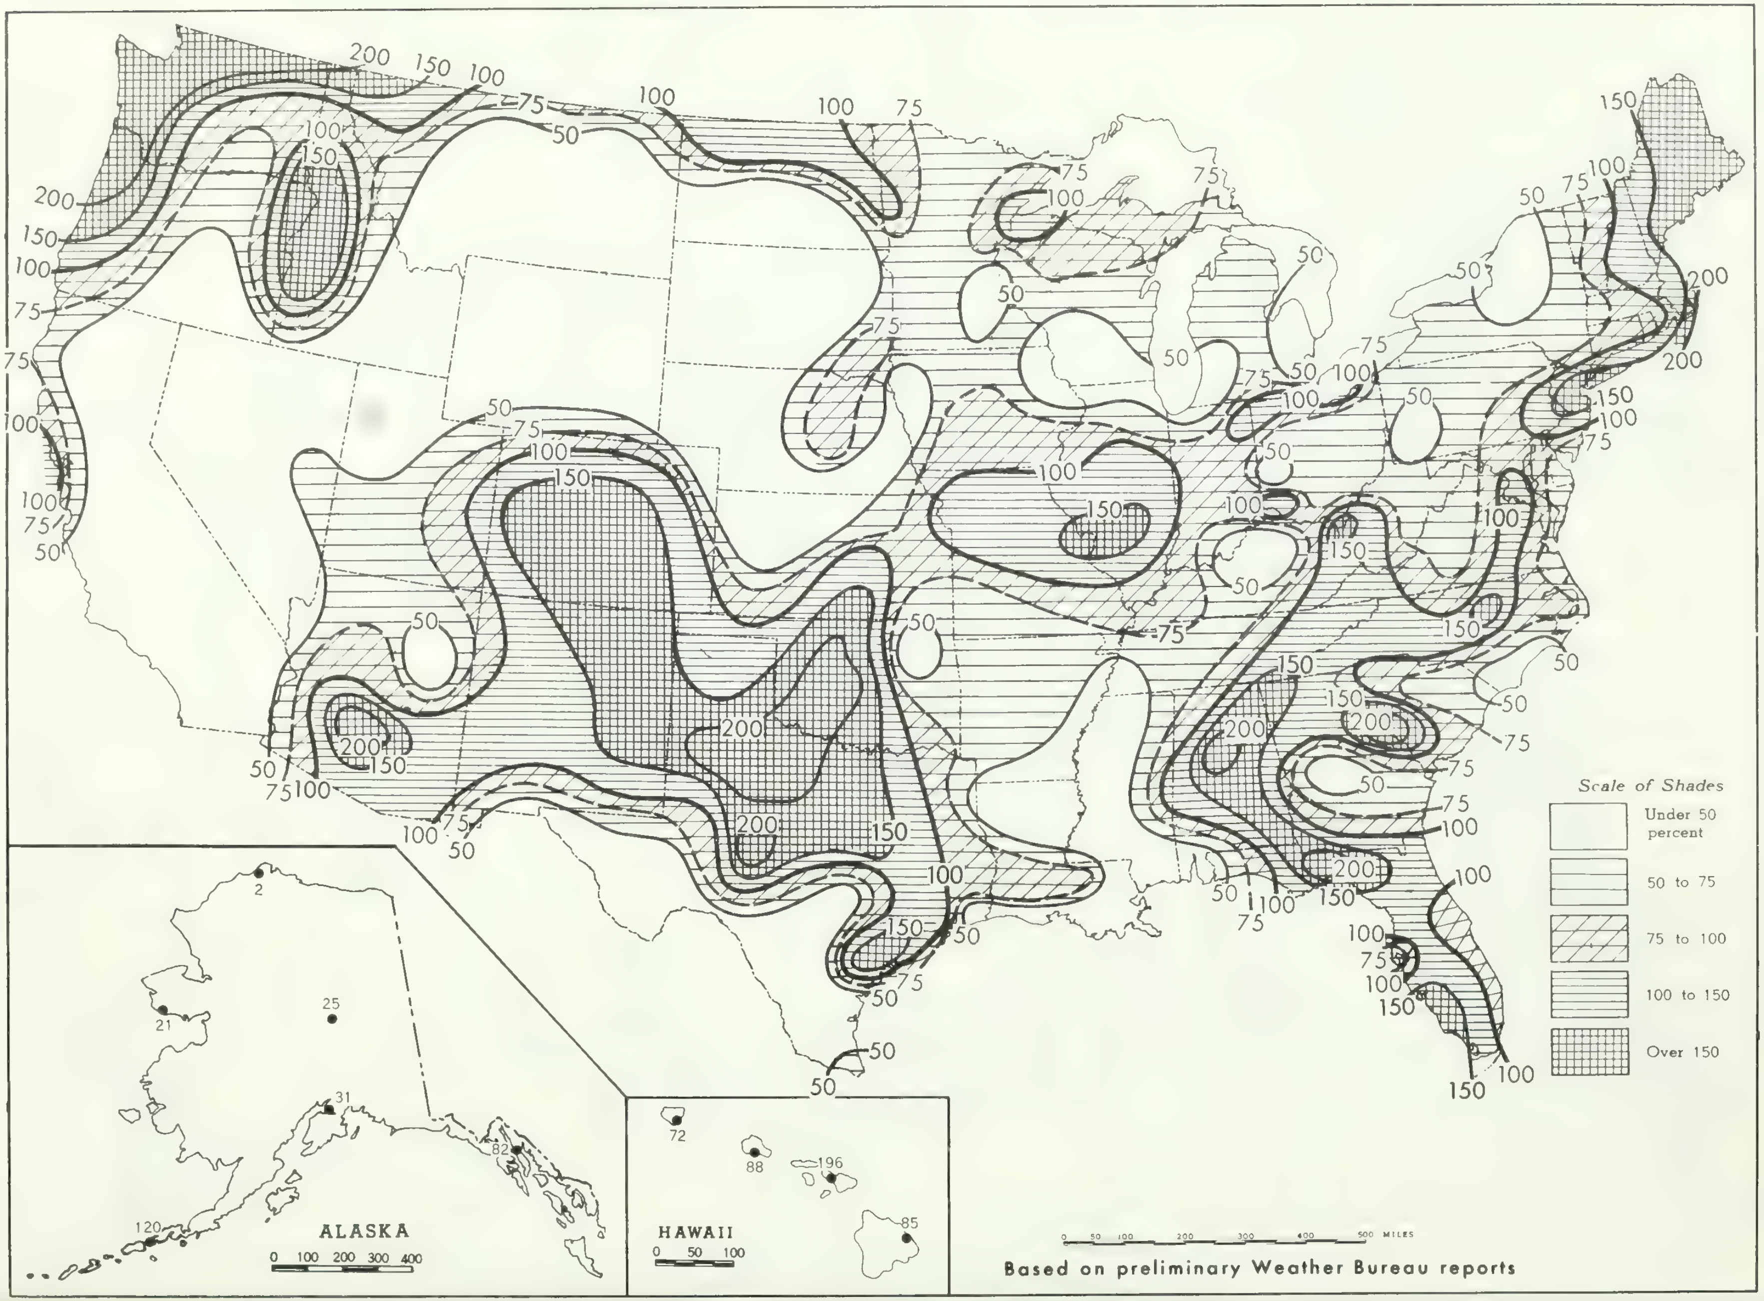

Chart VI. A. Percentage of Possible Sunshine, September 1969.

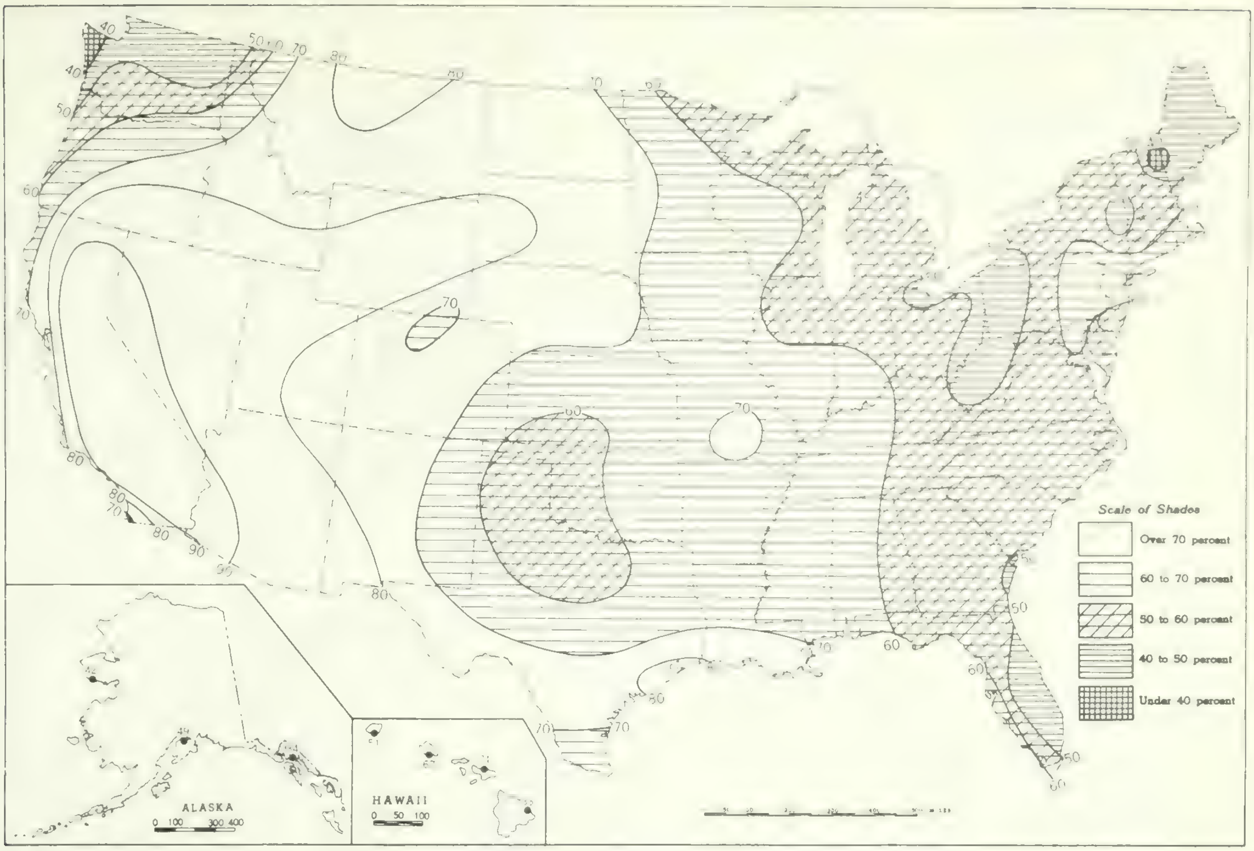
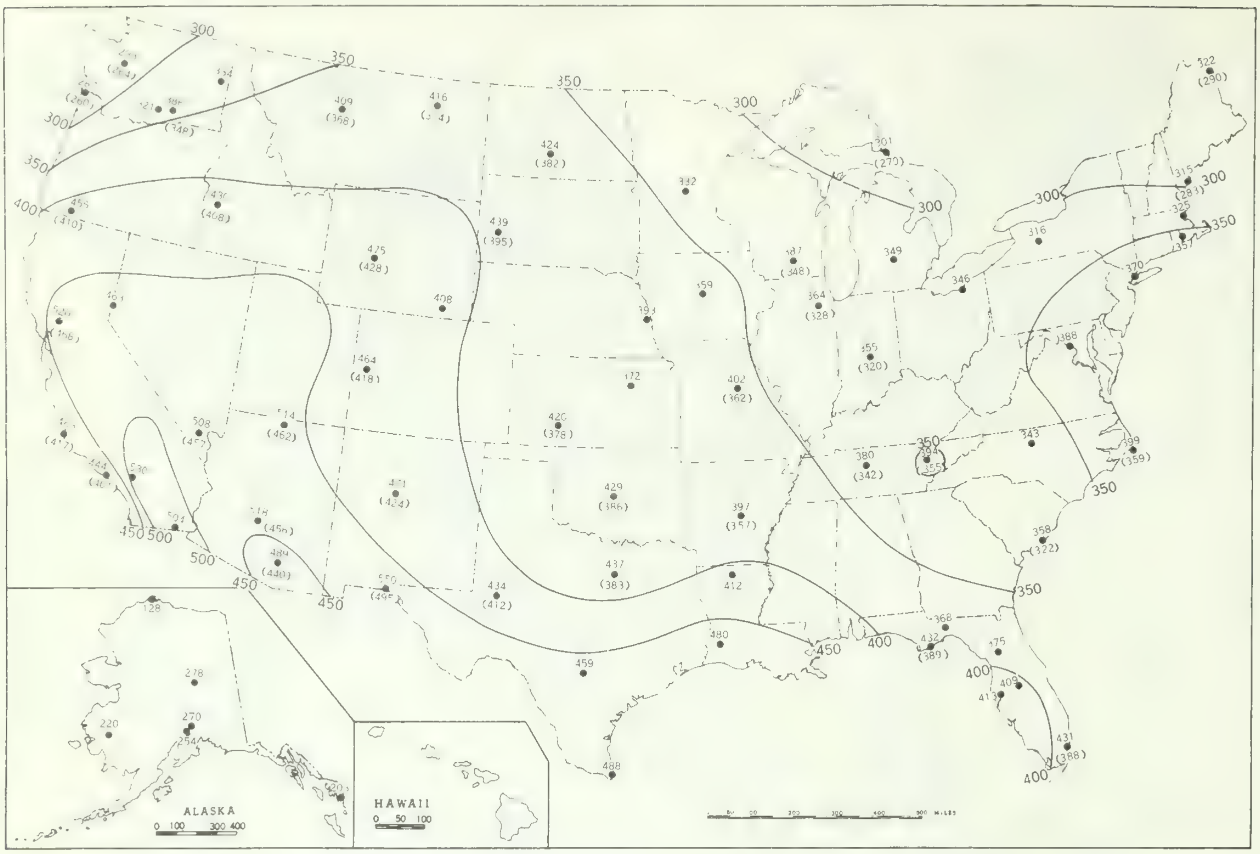


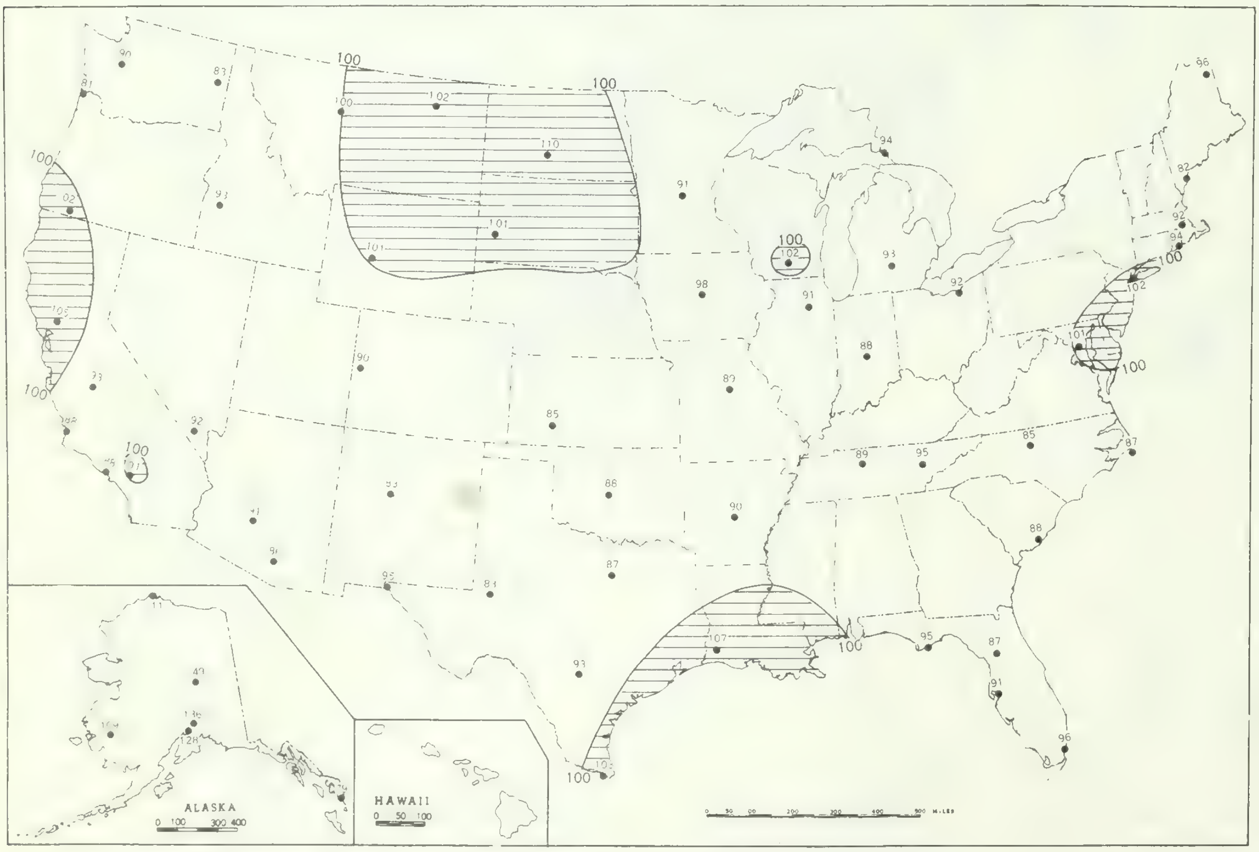
B. Percentage of Mean Monthly Sunshine, September 1969.

A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, September 1969.

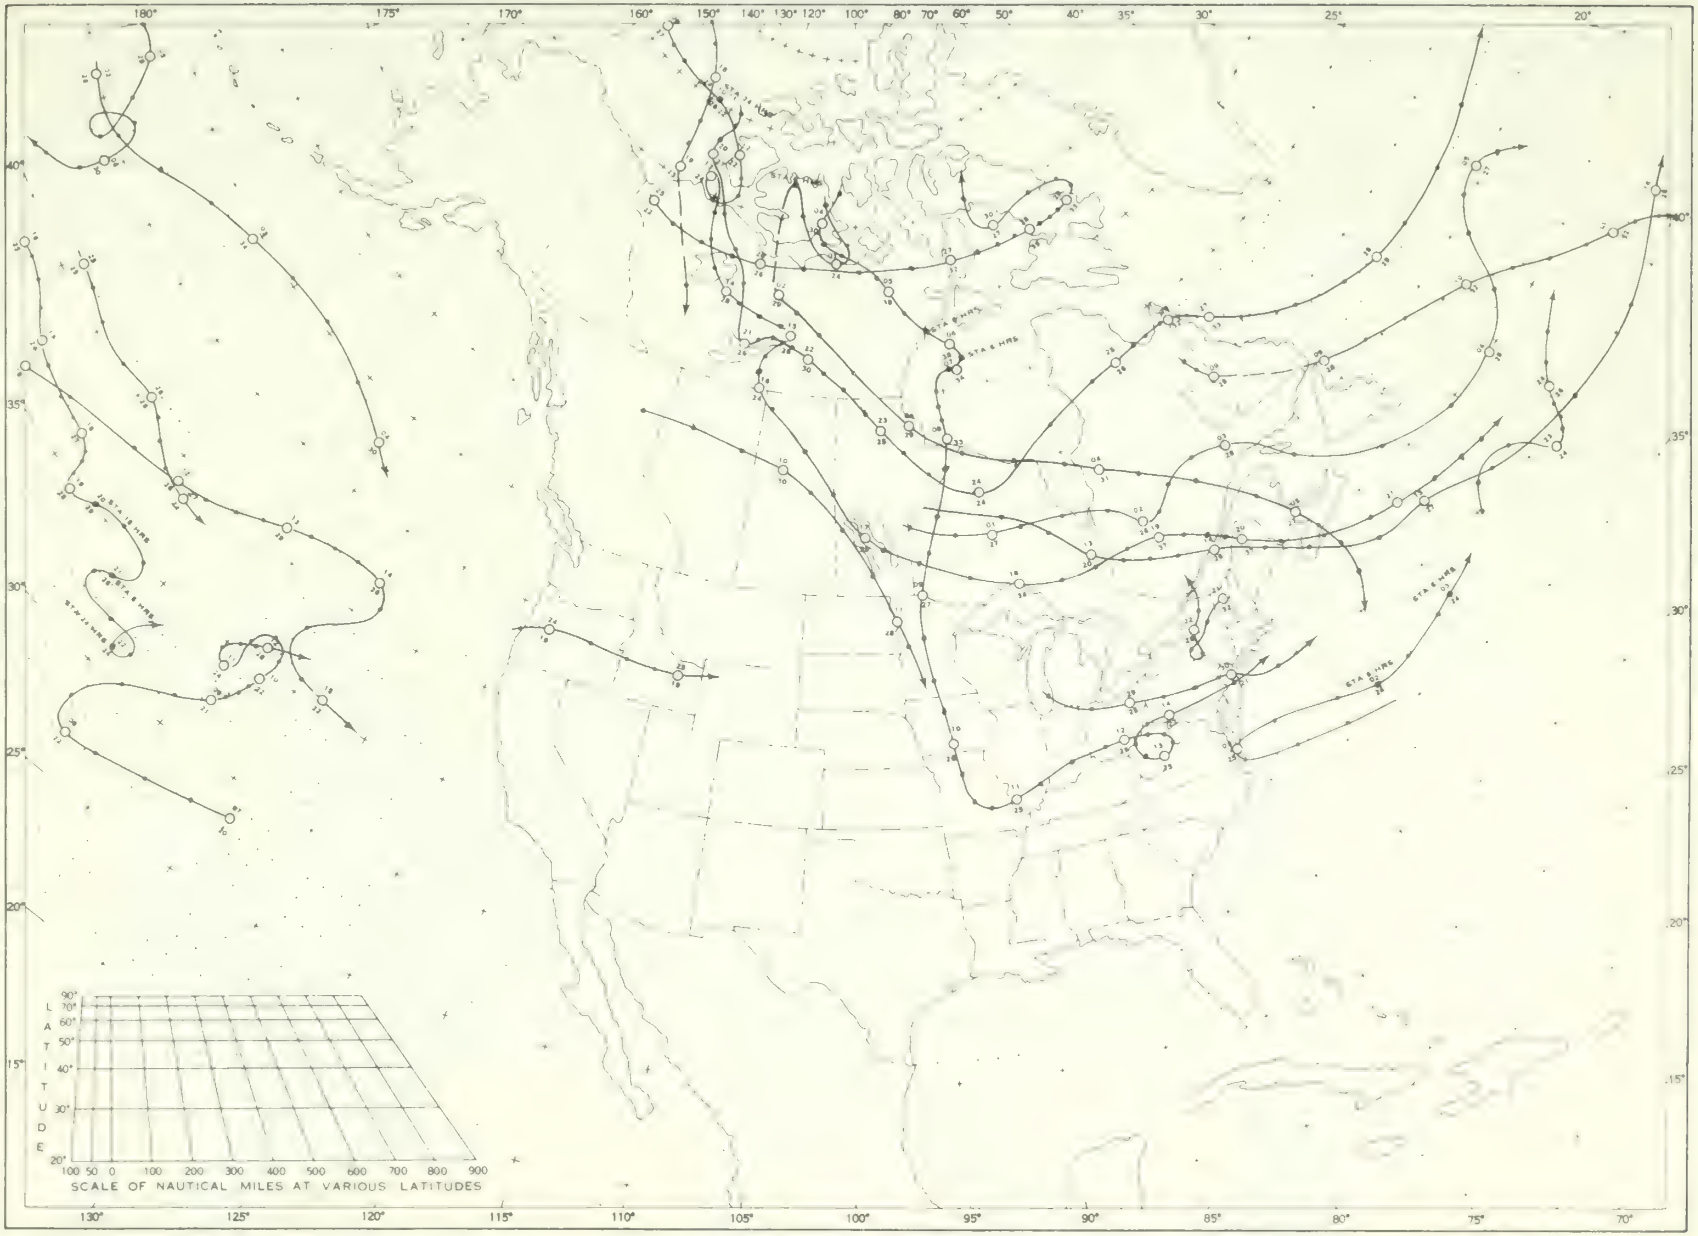


B. Percentage of Mean Daily Solar Radiation, September 1969.



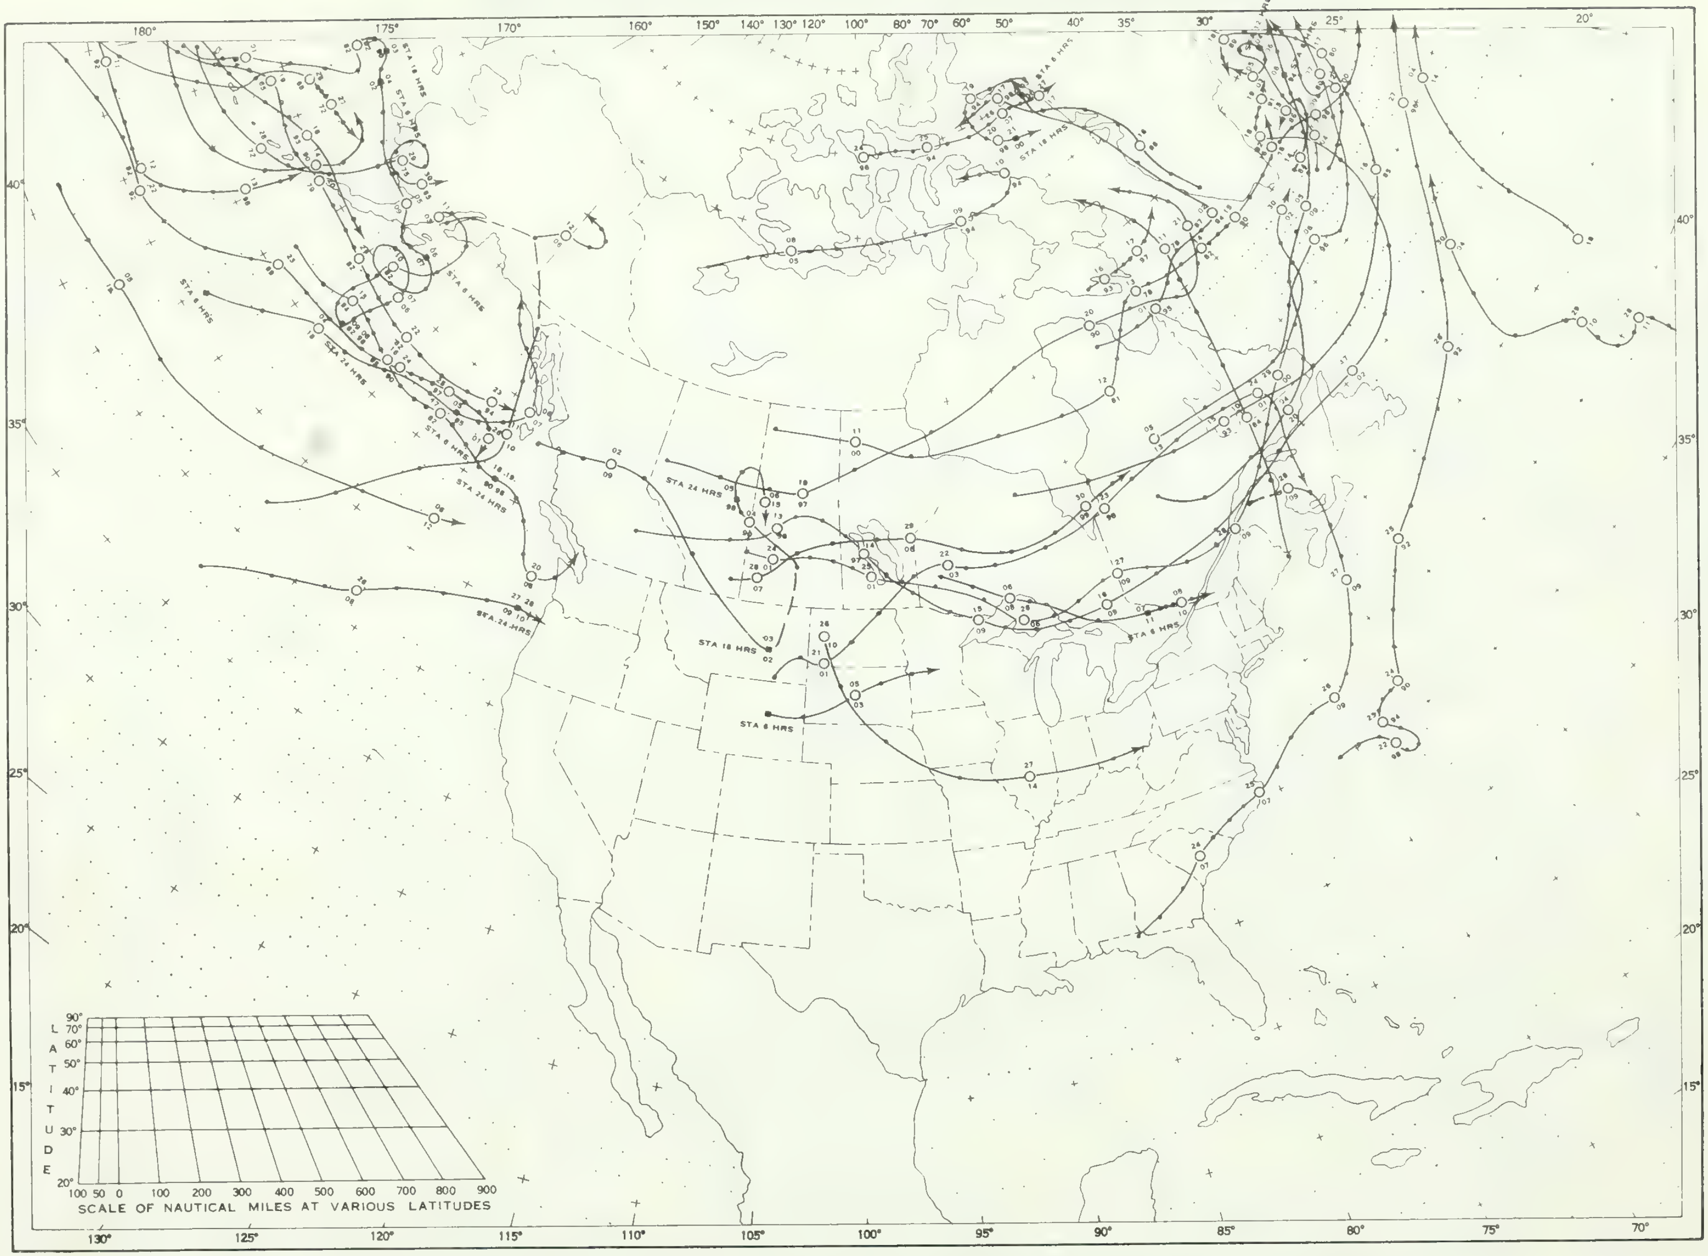
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, **September 1969.**



Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, September 1969.



Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, **September 1969**. Inset Departure of Average Pressure (mb) from Normal, **September 1969**.

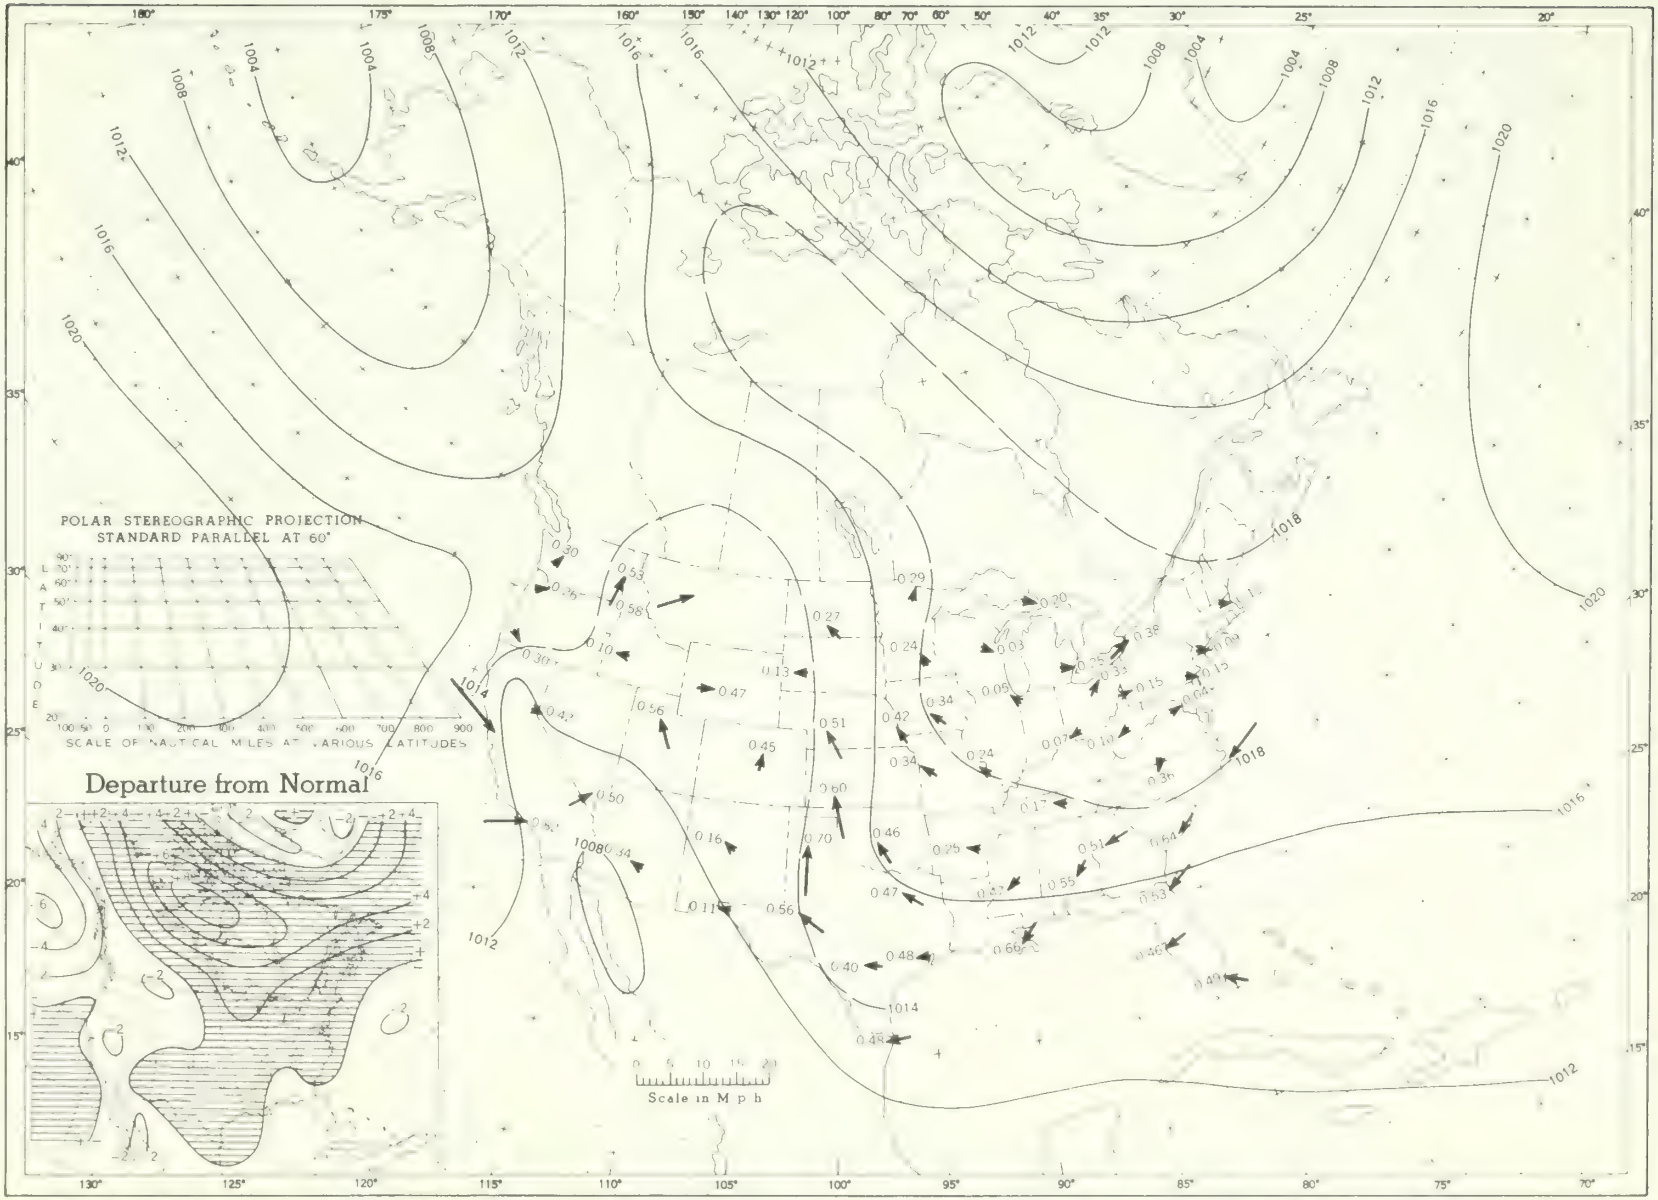


Chart XI. 850-mb Surface, 1200 GMT, September 1969. Average Height and Temperature, and Resultant Winds.

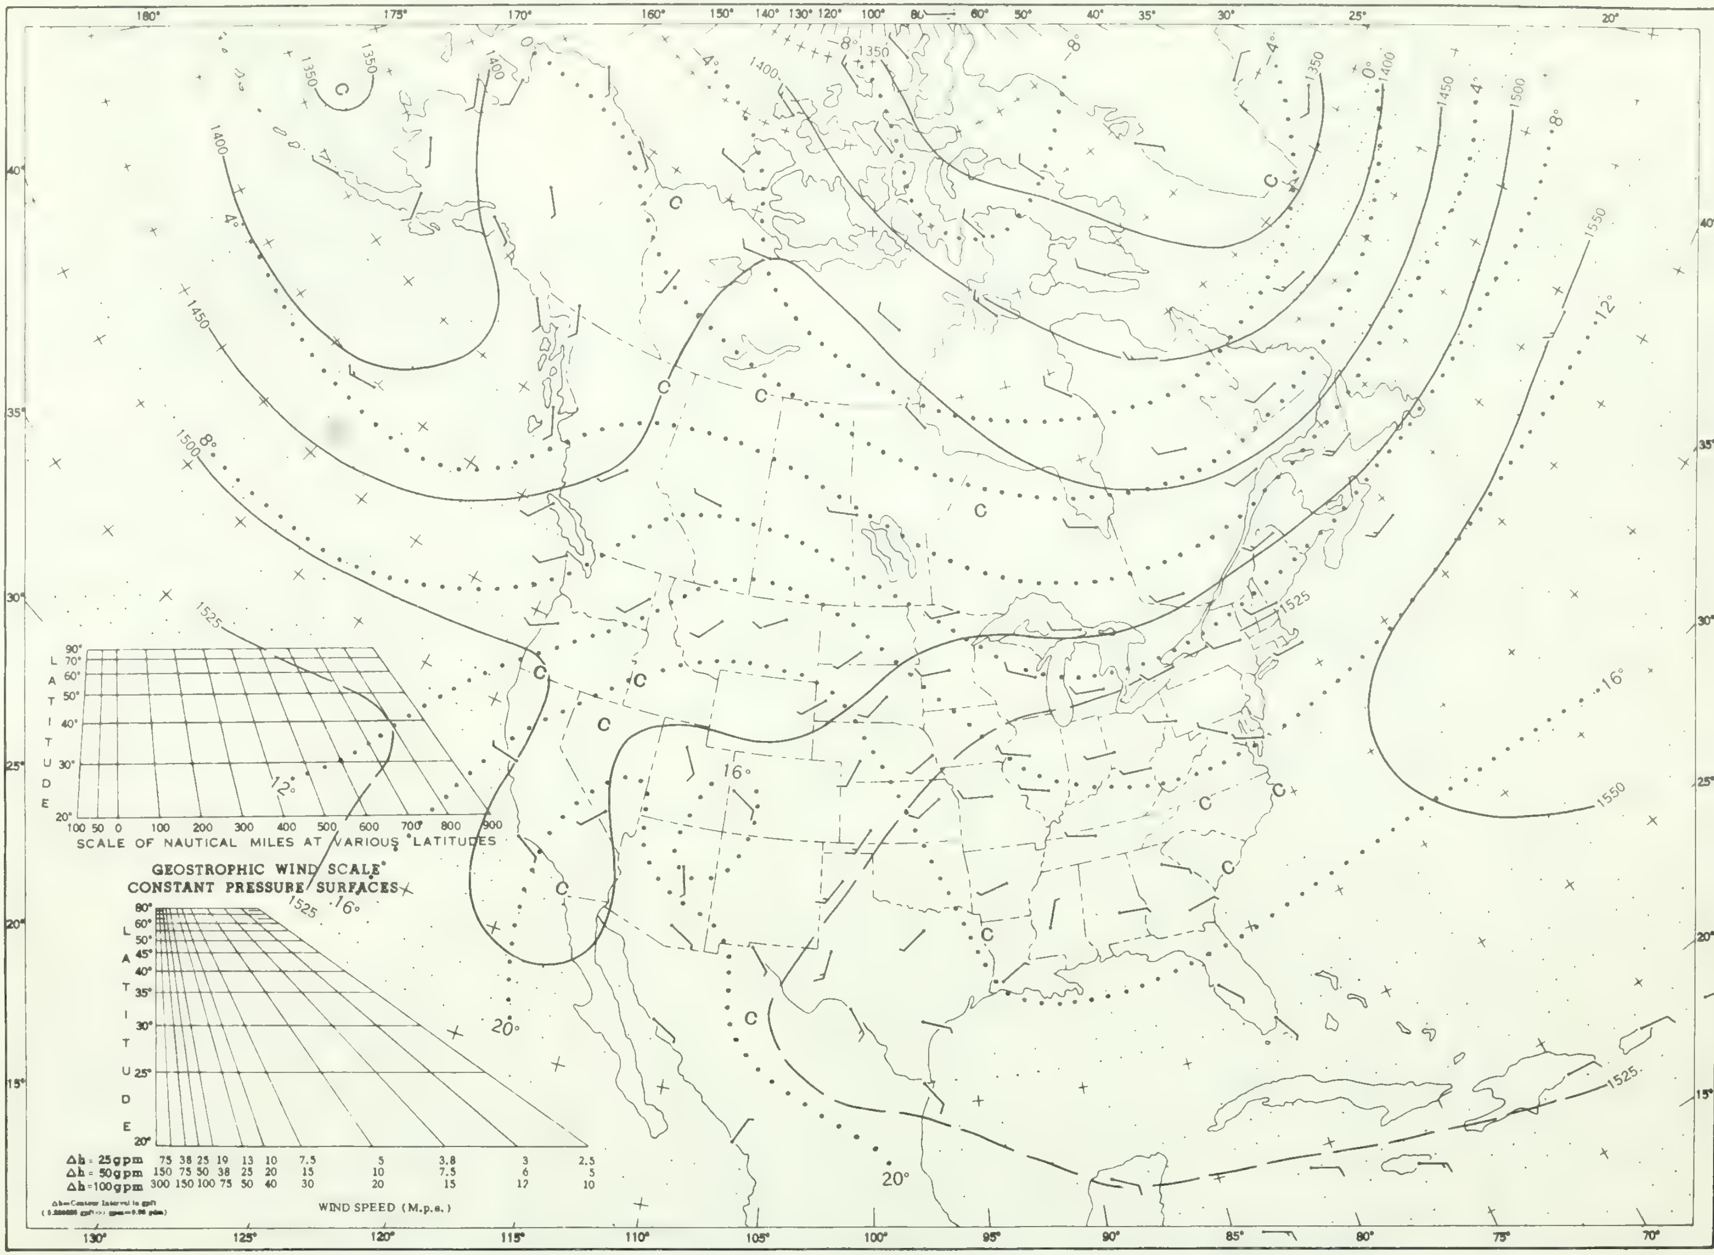
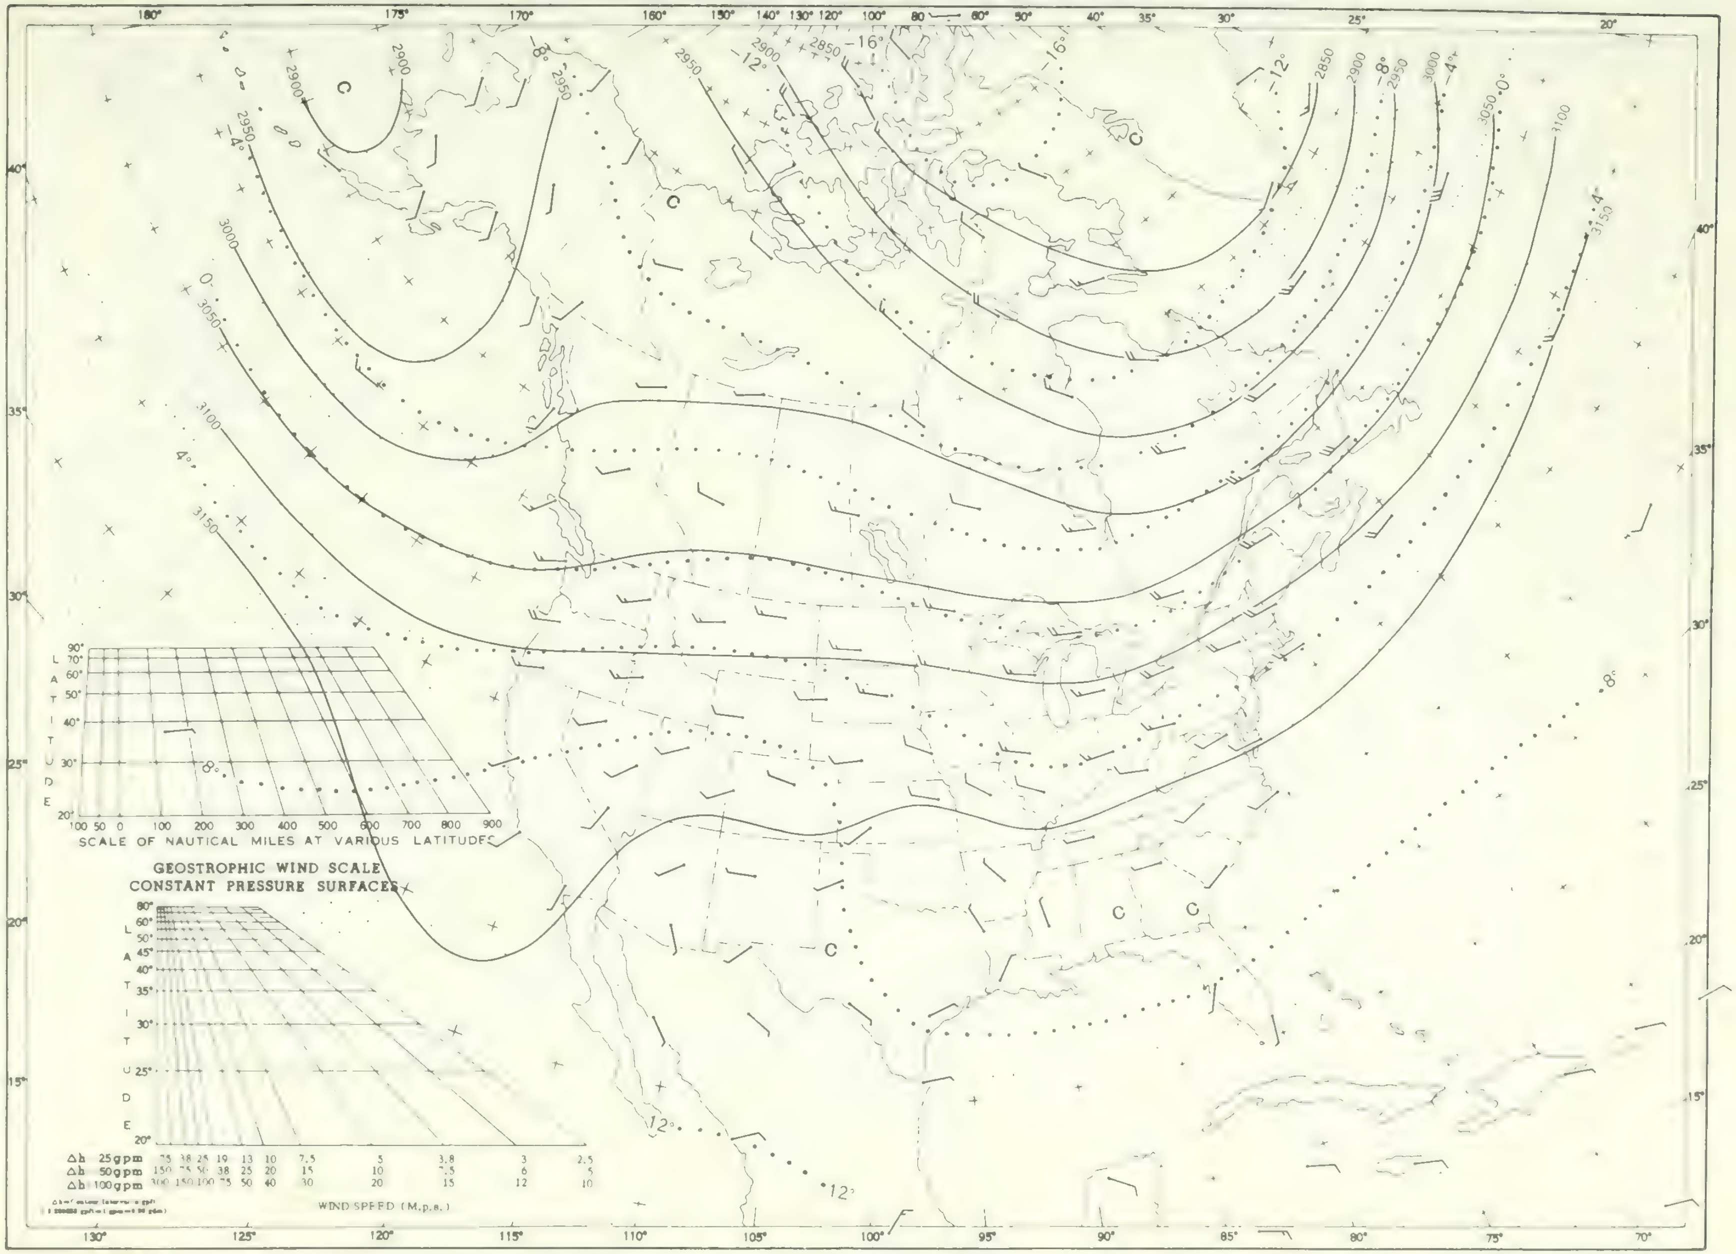


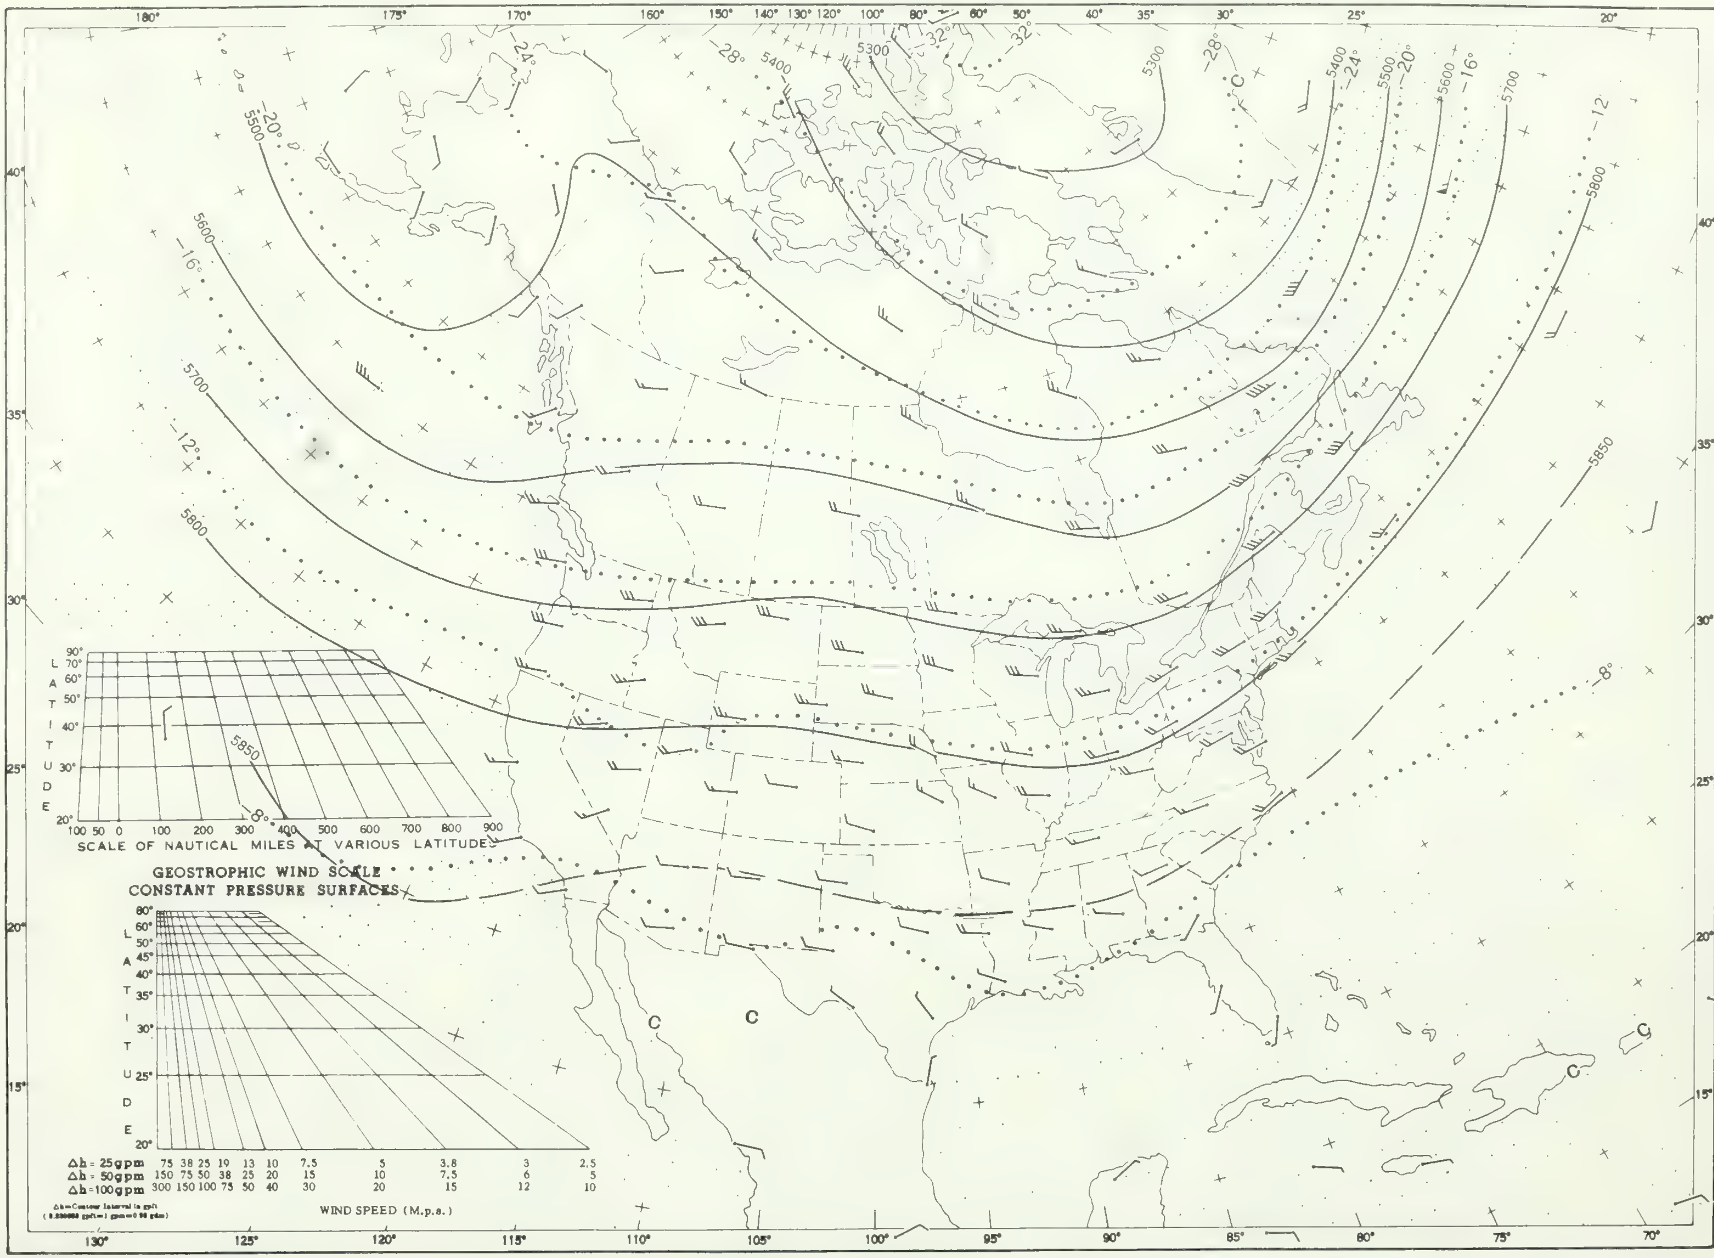
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb Surface, 1200 GMT, **September 1969**. Average Height and Temperature, and Resultant Winds



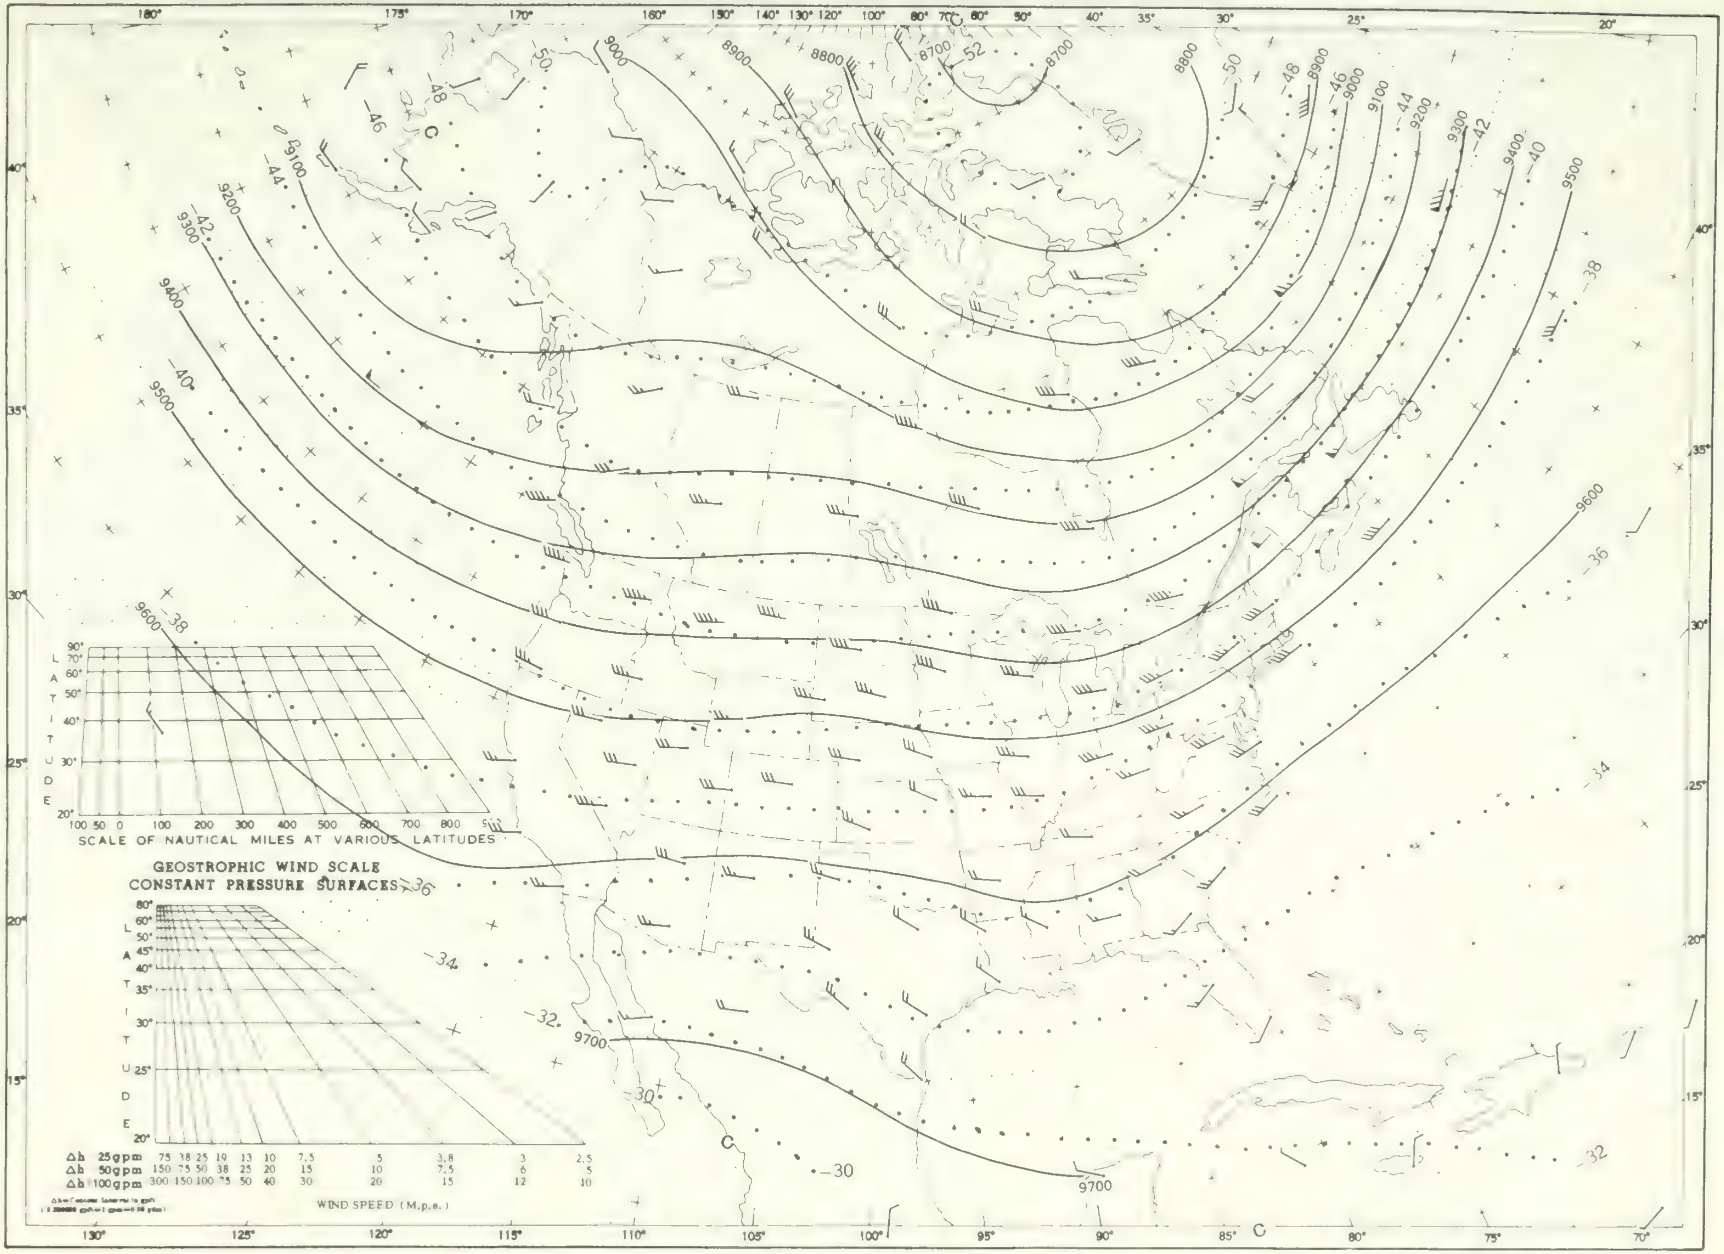
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII. 500-mb. Surface, 1200 GMT, September 1969. Average Height and Temperature, and Resultant Winds.



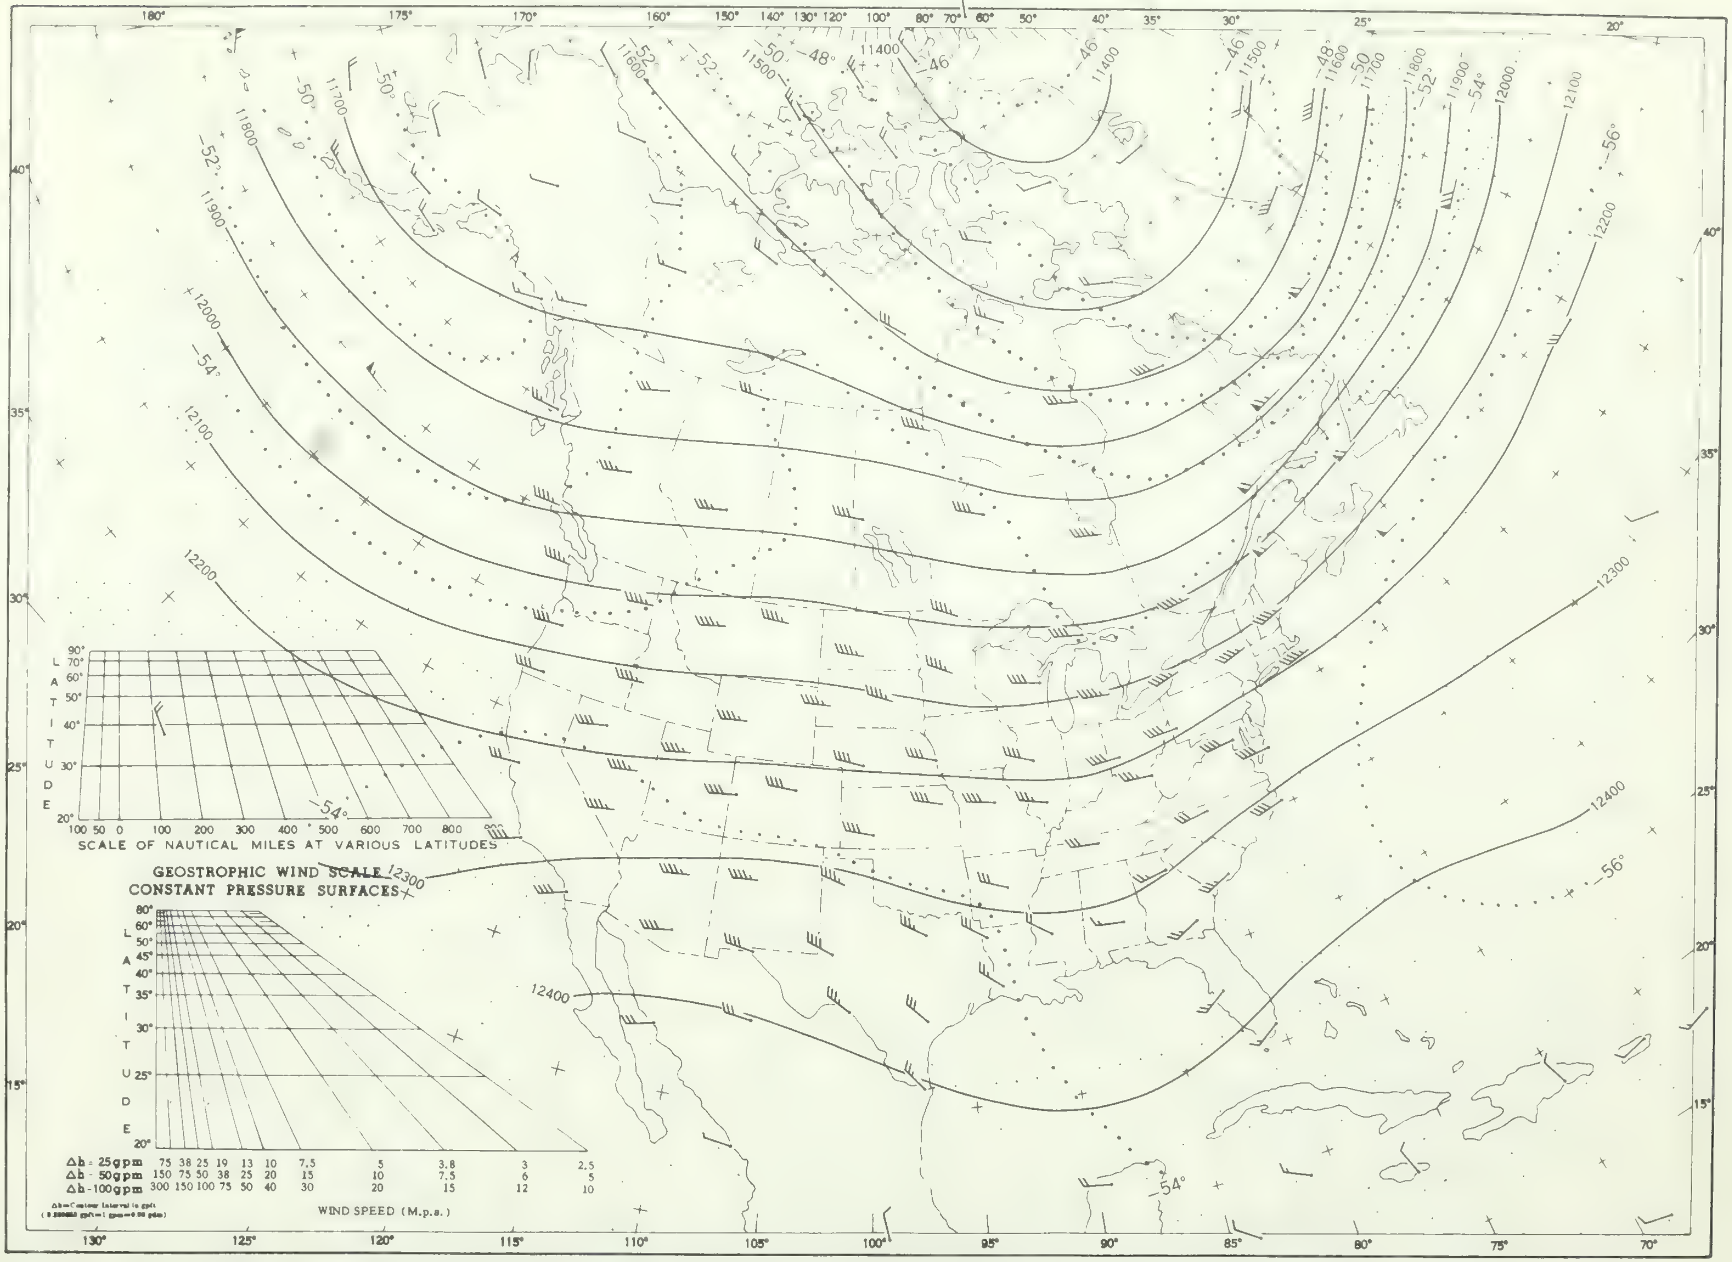
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV. 300-mb. Surface, 1200 GMT, September 1969. Average Height and Temperature, and Resultant Winds.



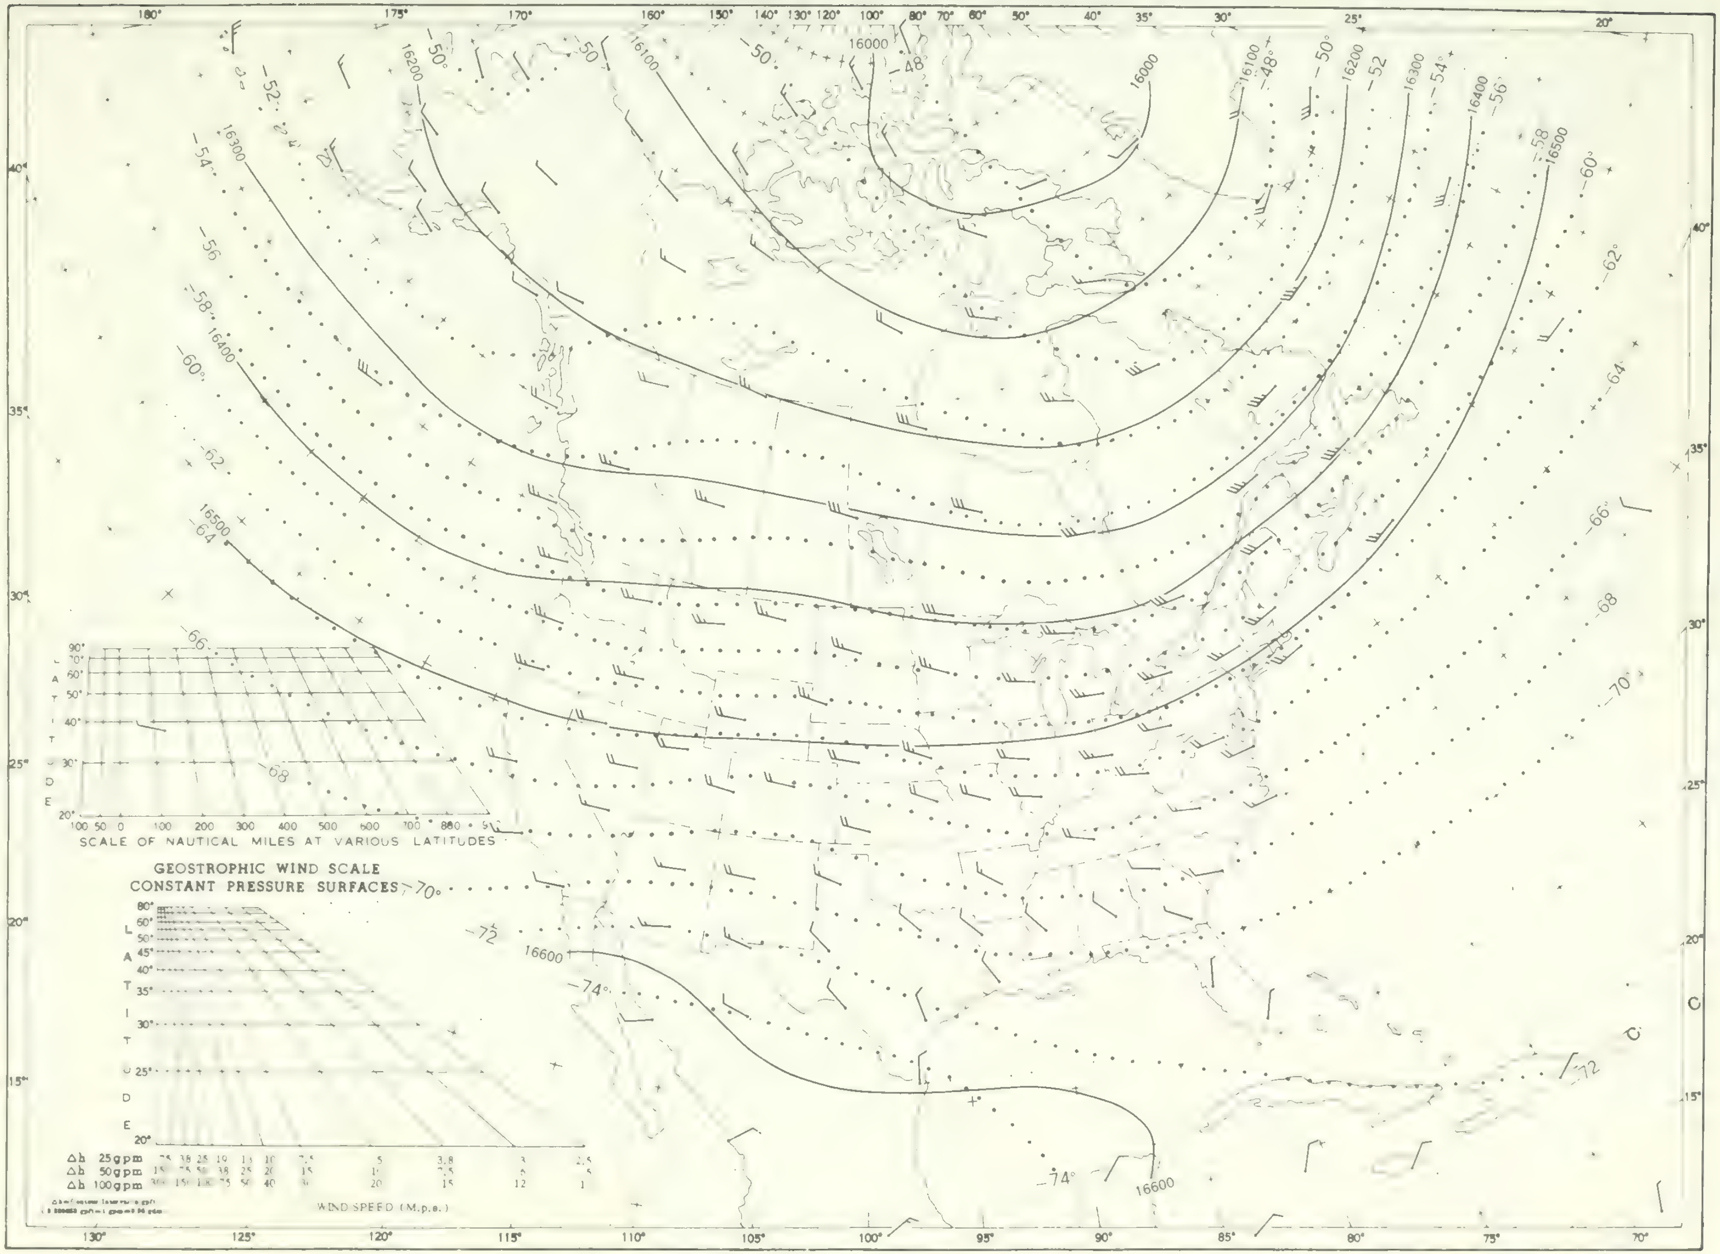
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV 200-mb. Surface, 1200 GMT, September 1969. Average Height and Temperature, and Resultant Winds.



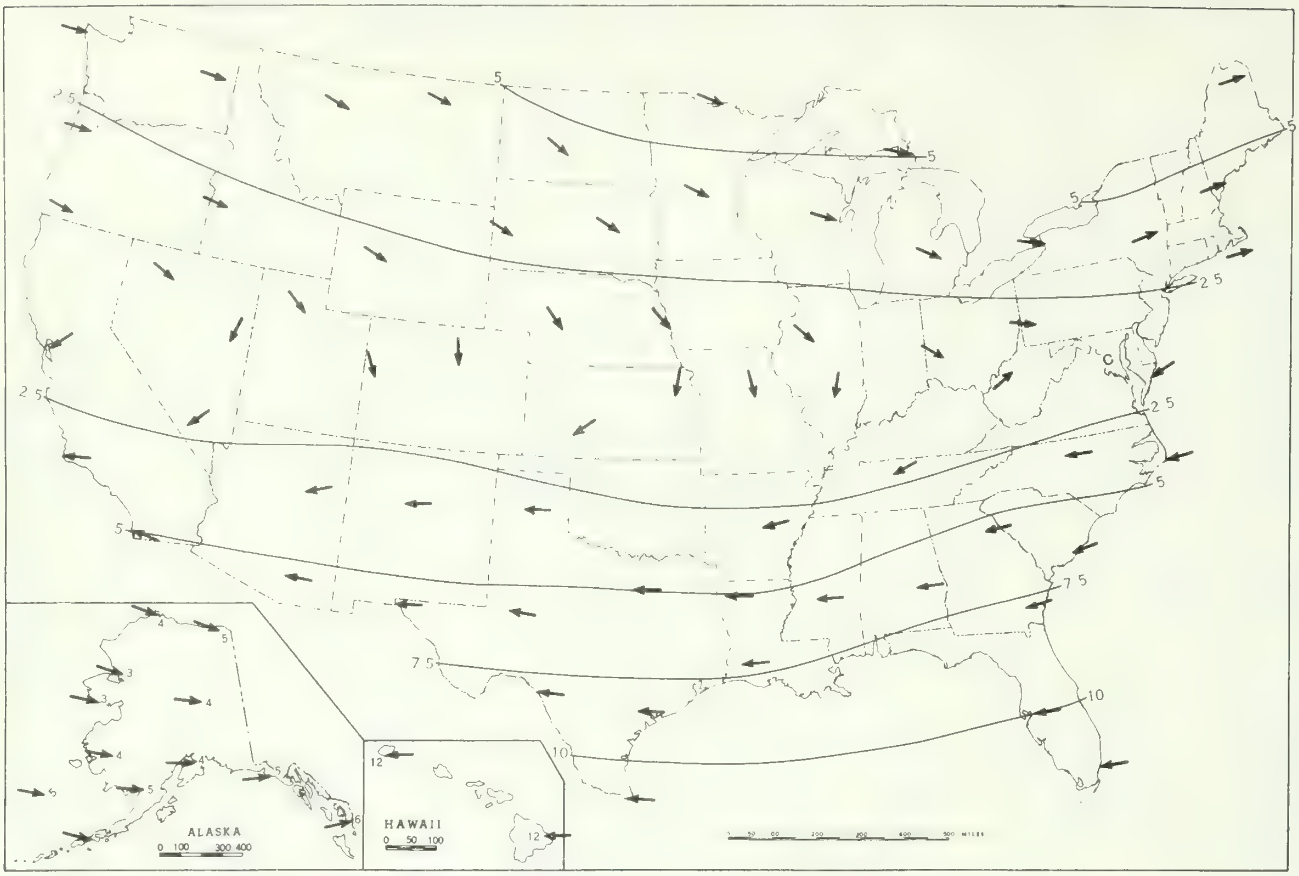
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI. 100-mb. Surface, 1200 GMT, **September 1969**. Average Height and Temperature, and Resultant Winds

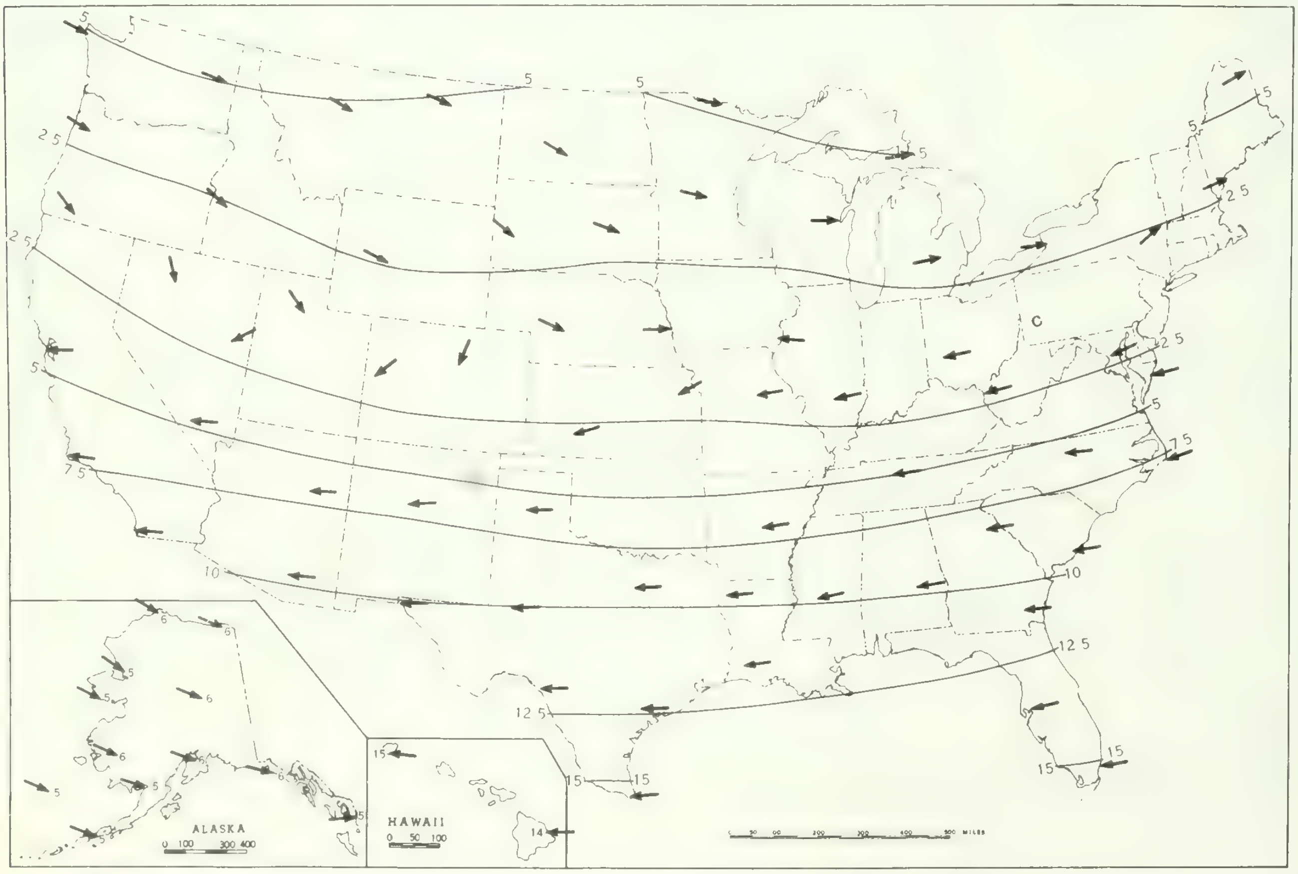


Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 GMT, September 1969. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, September 1969. Resultant Winds.



Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

NATIONAL SUMMARY

OCTOBER 1969
Volume 20 No. 10

Asheville 1970

CONTENTS

NOTE: Delayed data and corrections will be carried in the June and December issues of this publication. An explanatory page "Description of Charts" will be carried in the January and July issues.

SUBSCRIPTION PRICE: Monthly 20 cents and annual 40 cents per copy; yearly subscription, including monthly and annual issues, $2.50 domestic, $3.50 foreign. Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to "Superintendent of Documents, Government Printing Office, Washington, D.C. 20402"

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 20 No. 10 OCTOBER 1969

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. October 1969 was the coldest October in several decades over much of the West and North Central.
2. Record-low temperatures for so early in the season occurred at many spots in the Northeast.
3. Some locations in the central Rocky Mountains and the central Great Plains received more snow than in any previous October.

TEMPERATURE.--The battle between the polar and tropical air masses produced quick temperature changes over much of the Nation. This is characteristic of autumn weather in the middle latitudes.

A surge of wintry air pushed into the Far West early in October, ending the warm spell which had persisted through most of September. High pressure and cool weather dominated the weather in the western half of the Nation through the rest of the month. Subfreezing temperatures occurred frequently, except along the coast and in the southern portions of the southwestern deserts. Alamosa, Colo., registered 0° on Monday morning, October 13. October temperatures averaged 9° to 12° colder than normal over parts of the northern and central Rocky Mountains and more than 6° below normal over the western edge of the adjoining Great Plains. Temperatures changed erratically over the eastern half of the Country, however.

Mild weather prevailed over the central Great Plains at the beginning of October. A sharp change to cooler weather occurred about the middle of the first week. On the 9th a cold front stretched from north to south across the northern Great Plains. East of the front, brisk southerly winds carried Gulf air northward to the Great Lakes where Milwaukee, Wis., registered 77° in the afternoon after a morning minimum of 35°. West of the cold front, chilly air swept southward across the northern Rocky Mountains and western Great Plains, holding afternoon maximums in the 50's and 60's.

About the middle of the second week, a severe storm tumbled the temperatures to below freezing over the northern Great Plains and much of the central Great Plains. Las Vegas, N. Mex., registered 23° on the morning of October 12 and by the 13th, the temperature at Alamosa, Colo., had dropped to zero. As this big storm brought severe cold to the Central States, with afternoon temperatures in the 40's common in Iowa, summer heat prevailed farther east with maximums in the 80's from Ohio to the Gulf of Mexico. The middle of the 3d week of October brought the first widespread freezing temperatures of the season to the central and southern Appalachians. Chattanooga, Tenn., registered 30° on the morning of the 18th.

Unseasonably warm air continued from southern New England to the Gulf of Mexico until October 20 when Boston, Mass., and Baltimore, Md., registered 79° and 87°, respectively.

Cold northerly winds brought polar air across the Great Lakes and by the 23d, temperatures in the 20's were common in New England. Much of the Northeast had never been so cold so early in the autumn. Autumn chill intensified over the eastern two-thirds of the Country in the last few days of the month.

October temperatures averaged near or slightly above normal along the Gulf coast, in Florida, and along the Atlantic coast as far north as Maryland and slightly cooler than normal elsewhere in the East. The West averaged cooler than normal as was said earlier in this summary. In parts of the West, October 1969 was the coldest October in many years.

PRECIPITATION.--Rain fell along the northern Pacific coast early in October with snow above 4,000 feet in Washington. It accumulated to 1 to 3 inches above 7,500 feet in southern Idaho. Snow fell in the northern and central Rocky Mountains, reaching a depth of 4 inches at Leadville, Colo., by the morning of October 2.

Snow began late on October 3 in north-central and northeastern Colorado and continued until early on the 5th. The greatest amounts fell along the eastern slopes of the mountains and the adjacent plains in the northern part of Colorado, accumulating to 8 inches to 2 feet or more. The heavy, wet snow caused widespread damage to trees in full leaf and to power and communication lines and forced the removal of cattle from mountain ranges.

Showers and thunderstorms occurred from the northern and central Great Plains to the Great Lakes. A low-pressure system moved inland from the Gulf, causing widespread rains from the middle and eastern Gulf coast northward to the Ohio River. About the middle of the first week of October, torrential rains caused flash floods in southwestern Kansas and between Del Rio and San Antonio, Texas. Uvalde, Texas, measured 12.70 inches on the morning of October 5. Flash flooding from the Texas rains is described in the General Summary of River and Flood Conditions in this publication.

Near the end of the first week of October, heavy rains fell along a cold front that extended from Lower Michigan to Texas. As the front moved eastward, the precipitation zone moved eastward also. Flood-producing showers fell in Louisiana during the night of October 6; 10.50 inches at Oaknolia in 12 hours.

A Pacific front moved inland over the western coast and gale winds pounded the shore from Washington to California. Substantial rains fell in the Northwest in connection with this storm.

A second storm of near-record severity struck Colorado on October 11 and 12. Drifting snow blocked the roads in the mountains and in the eastern Great Plains. Like the previous storm, trees and powerlines sustained heavy damage. After this storm, snowfall in many areas had exceeded previous records for the entire month of October.

Freezing rain fell south of the snow belt, as far south as New Mexico and the Texas Panhandle. East of the snow belt, showers and thunderstorms dumped heavy rain from Texas to the Ohio River Valley. The 4- to 10-inch storm totals caused flash flooding along the streams in several States, especially Oklahoma, Missouri, and Illinois.

About midmonth heavy snow spread over the Upper Mississippi River Valley and blowing and drifting continued in the central Great Plains. Snow accumulated to a foot deep in northeastern Colorado and western

Nebraska. South of the snow belt, torrential rains along a slow-moving cold front which stretched from the Great Lakes to Texas, caused a quick rise in rivers across a 5-State area from Oklahoma to central Illinois. Flooding was most extensive in Missouri.

The second storm in less than a week to hit the central Great Plains developed in the central Rockies shortly after midmonth. It dumped 8 inches of snow at North Platte, Nebr., during the forenoon of October 15 and by the following day was bringing snow from the Dakotas to Wisconsin, a mixture of snow and rain in the transition zone, and rain farther south and east.

On the 18th and 19th, Tropical Storm Laurie produced some heavy showers in the Florida Keys. Laurie subsequently developed into a hurricane.

At the beginning of the last week of October, northerly winds, blowing across the Great Lakes, picked up moisture and deposited it as snow in New York and New England. Rochester, Vt., received 1 foot of snow on October 22 and even greater amounts fell in the mountains. This was one of the heaviest October snows of record in New England.

Locally heavy rains fell in the Rio Grande Valley in the last week of October with several inches falling in the Laredo vicinity accompanied by winds gusting to 68 m.p.h.

Many areas received heavy snow in the last few days of October. Ten inches fell at Bozeman, Mont., on the 28th. Several inches fell in parts of Colorado, eastern Wyoming, much of the Nebraska Panhandle, and western Kansas.

October rainfall exceeded the normal amounts over a wide area from Utah and New Mexico to the Great Lakes, in a narrow strip from the middle Rio Grande to Illinois and Indiana, and in the southern and eastern portions of the Florida Peninsula.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70°F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1 minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1 C. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

C Crop damage
° Includes crop damage

* No occurrence of storms or unusual weather phenomena.

‡ Includes heavy sleet storm.
\# Freezing drizzle and freezing rain, commonly known as glaze.
ø For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, ESSA, monthly publication STORM DATA.

† Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5,000,000
7 $5,000,000 to $50,000,000
8 $50,000,000 to $500,000,000
9 $500,000,000 to $5,000,000,000.

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

OCTOBER 1969

Elmer R. Nelson, Office of Hydrology

Major flooding occurred in the lower Marais des Cygnes Basin in Kansas during October. Crests ranged from 4 to 8 ft. above flood stage. Agricultural losses were estimated at $1.25 million. Record flooding occurred on the lower Salt River and on the Cuivre River in Missouri. Extensive damage resulted to crops.

ATLANTIC SLOPE DRAINAGE

Heavy rain (2 to 4 inches) on the 1st and 2d caused minor flooding on the lower Cape Fear and the middle portion of the Neuse River in North Carolina on the 4-6th. The crests on the Cape Fear River averaged slightly over 2 feet above flood stage and on the Neuse, slightly above flood stage.

Flooding continued along the Lumber River at Lumberton, N. C., from Sept. 25 to Oct. 16. The crest on the 10th was 2.3 ft. above flood stage. Damage was minor and mainly to residential property.

Minor flooding occurred on the Satilla River near Atkinson, Ga., on the 3d-7th. No flood damage was reported.

EAST GULF OF MEXICO DRAINAGE

Light to moderate flooding occurred on the Hillsborough and Alafia Rivers between the 3d and 5th. The crests on the 4th were less than 1 foot above flood stage. Light flooding occurred on the Withlacoochee River at Croom, Fla., on the 6-17th. The crest on the 9th was less than 0.5 foot above flood stage. The flooding was due to heavy rains accompanying Hurricane Jenny. In the vicinity of Sebring, Fla., the District Soil Conservationist estimated 500 acres of citrus groves were flooded as well as many homes, trailers, and roads. The estimate of damage is approximately $1 million.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--Heavy rains on the 10-13th caused considerable flooding on streams in northeast Missouri and west-central Illinois. Rainfall totals ranged from over 5 inches to more than 10 inches. One of the hardest hit areas was the Cuivre River Basin in east-central Missouri. A survey of the area from Old Monroe, Mo., to Troy, Mo., revealed that the flooding was probably the highest of record, exceeding the previous record flood of 1941. High water topped the levees which protected much of the area, flooding and severely damaging homes behind the levees. There was also considerable crop damage since corn and other crops were still in the fields. Widespread serious flooding occurred along the lower Salt River where a record crest of 30.62 ft. was reached at New London, Mo., on the 14th. Flood stage at this point is 19 ft. The previous highest crest of record was 29.92 ft. on Aug. 2, 1958. Extensive damage resulted to crops along the Salt River.

The heaviest flooding in Illinois occurred on the Illinois River at Meredosia, Ill., where flood stage was exceeded by 4.8 ft. The river was out of its banks from the 16th to the 25th, a period of 10 days. Other streams affected by the heavy rains were the Sangamon, Lamoine, and Kaskaskia, which exceeded flood stage by up to 4 ft.

The main stem of the Mississippi River exceeded flood stage in the lower reach at and below Winfield, Mo., a distance of 205 miles. The average overflow was 2 to 4 ft.

Missouri Basin.--Considerable flooding occurred in streams in northwestern and central Missouri near the middle of the month. This was due to heavy rains on the 9th, 10th, 12th, and 13th. The rains averaged more than 1 inch on the 9-10th with some stations reporting more than 3 inches. The rain was the heaviest in west-central Missouri on the 12-13th with an unofficial amount of 7 inches at Pleasant Hill, Mo., which closed highways east and west of the city. A busy intersection in Kansas City was inundated to a depth of 1 foot. U. S. Highway 71, south of Kansas City, was under water for a short time.

The Moreau River near Jefferson City, Mo., crested 8.5 ft. above flood stage on the 14th. The Marmaton River at Nevada, Mo., crested at a stage of 26.2 ft. on the 13th, 4.2 ft. above flood stage. Only minor flooding occurred downstream at Fort Scott, Kans.

Major flooding occurred in the lower Marais des Cygnes Basin below Ottawa, Kans., during midmonth. Crests ranged from 4 to 8 ft. above flood stage from Osawatomie downstream and also on Pottawatomie Creek. Minor flooding occurred on the upper Marais des Cygnes River at Quenemo, Kans. The flooding was due to 4- to 6-inch rains on the 10-12th. Additional rainfall of an inch or more on the 18th delayed the recession of the lower Marais des Cygnes and produced moderate rises upstream. Agricultural losses were heavy in the lower Marais des Cygnes Valley with preliminary estimates in excess of $1.25 million, mainly to late-planted corn, soybeans, and sorghums still in the fields and to some new-sown wheat. The same area had been flooded in June, and many fields had not been replanted; so, the acreage of crop loss was not as great as it would have been.

Some flooding occurred on the lower Missouri River from Boonville, Mo., to its mouth between the 13th and 19th. Crests on the 14th ranged from 3.4 ft. above flood stage at Boonville, Mo., to 8 ft. above flood stage at Hermann, Mo. The crest at St. Charles, Mo., on the 15th was 6.2 ft. above flood stage.

Ohio Basin.--Moderate to heavy rain on the 11th to the 12th caused minor flooding on the Skillet Fork and Little Wabash Rivers in Illinois on the 12-14th. Storm totals in the lower Wabash River Basin exceeded 5 inches. The streams rose rapidly to above bankfull stage, causing minor flooding of adjacent farmland. No damage resulted from this flooding.

Arkansas Basin.--Heavy rain (5 to 6 inches) on the 11-13th caused flooding of streams in northeastern Oklahoma and southeastern Kansas. The total storm rainfall at Webbers Falls, Okla., was 13.3 inches and at Checotah, Okla., 12.27 inches. All streams had crested higher previously during 1969 except Bird Creek at Sperry, Okla., which reached its highest stage since March 1968. The crest on the 13th was 5.1 ft. above flood stage. A bridge on North Lewis Avenue and part of 96th Street northeast of Sperry were under water during the night of the 13th. State highway east of Skiatook was closed most of the 13th. Damages from the flooding was minor.

The excessively heavy rain on the 11-12th caused some creeks to overflow in the vicinity of Calvin, Okla. Minor flooding occurred on Deep Fork from Welty to near Beggs, Okla., and on Coal Creek west of McAlester on the 12th. Residents reported that Coal Creek was the highest in several years. Some homes in Henryetta, Okla., was flooded due to surface drainage. U. S. Highway east of Henryetta was briefly under water.

Red Basin.--Minor flooding occurred in the headwaters

of the Red Basin during October. Brief flooding occurred on the Blue River at Blue, Okla., on the 14th. Clear Boggy Creek at Caney, Okla., was out of its banks on the 13-16th. The Sulphur River at Hagansport, Tex., crested nearly 6 ft. above flood stage on Oct. 31 and receded within its banks on Nov. 1. Rainfall during the month ranged from 5 to near 12 inches in southeastern Oklahoma and 2 to near 7 inches in northeastern Texas and southwestern Arkansas. Most of the rain fell during the middle and last of the month.

WEST GULF OF MEXICO DRAINAGE

Heavy rain during the afternoon and night of the 4th over the upper Colorado River Basin in Texas caused rapid rises on tributary streams. The Llano River at Llano, Tex., crested at 26 ft. which was high enough to release tons of debris and mud downstream into Lake Lyndon B. Johnson. The lake level rose 3 ft. in a short time, necessitating the opening of the flood gates on the dam. The outflow caused the level of Lake Marble Falls, just below the dam, to rise 6 ft. in a short time. The widespread heavy rains took the life of a young resident as he attempted to drive across a flooded low water crossing. The high and rapid rises on the usual constant level lakes caused much damage to boat docks, boats, pumps, and pump houses and other personal and public property.

Heavy rains over the upper Nueces on the night of the 4th and moderate rains over most of the lower watershed on the 5th caused flooding in the Nueces Basin at and below Crystal City, Tex. Moderate flash flooding occurred on the upper Frio from Garner State Park southward. All roads out of Uvalde were closed on the morning of the 5th except U. S. Highways 90 and 83. Two persons were drowned in a car in the flood on the Dry Frio. Moderate flooding occurred on the Nueces at Cotulla, Tex., and minor flooding above and below.

Heavy rains on the morning of the 12th caused flash flooding on the Nueces and Frio Rivers north of Uvalde, Tex., through the 12th. Considerable flooding continued on the Nueces north of U. S. Highway 90 through the 13th and moved downstream to Crystal City on the 14th. Bankfull stages continued downstream below Crystal City. Low water crossings were closed on the West Nueces with minor flooding continuing through the 13th. Moderate flooding occurred on the Frio near Derby, Tex., on the 14th and 15th. Minor flooding occurred below Derby through the 20th.

Heavy rains on the 27th caused moderate flooding on Turkey Creek from the 28th to Nov. 2. A moderate rise moved down the Nueces below Turkey Creek, with bankfull stages at Cotulla through the end of the month. Minor flooding occurred near Tilden through the first week of November. Flash flooding closed numerous roads on the 27th in the vicinity of Uvalde, Tex., to near Blewett.

Lake Corpus Christi filled to the capacity level of 94 feet on the 19th and remained at that level or slightly higher through the end of the month. Below Wesley Seale Dam bankfull stage with occasional minor flooding occurred from the 20th into November.

FLOOD STAGE DATA

(All dates in October unless otherwise specified) OCTOBER 1969

Note: All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.
The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.
\+ Observations for these stations are scheduled at 0000 G.C.T.
† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the surface and higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun.

S Slight haze - indeterminable
* Values corresponding to true solar noon
IGFH Intense ground fog and haze

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys. OCTOBER 1969

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a.m.) at Palmer, Alaska

OCTOBER 1969

Date. . . .	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	38	-6	-13	27	-33	-15	-54	14	-53	-19	-50	-68	-51	-56	-38	-37	-50	-87	-67	-50	-30	-27	-37	-37	-35	-33	*	-19	-25	-29	-89	-33

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the ESSA, Weather Bureau.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (< 3900 Å) at Ames, Iowa

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	6.27	9.70	11.12	11.36	4.14	12.55	12.07	12.55	8.52	6.27	9.82	1.89	5.09	12.66	2.96	9.70	11.36	4.73	3.07	9.35	7.69	8.16	8.40	5.32	5.20	8.16	9.35	9.47	7.22	0.71	2.96	7.67

These data are from an U - V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the ESSA, Weather Bureau.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λs Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

Station	Day of month																														
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O_3
															Data will be delayed																	

The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λs designates the type of measurement made.

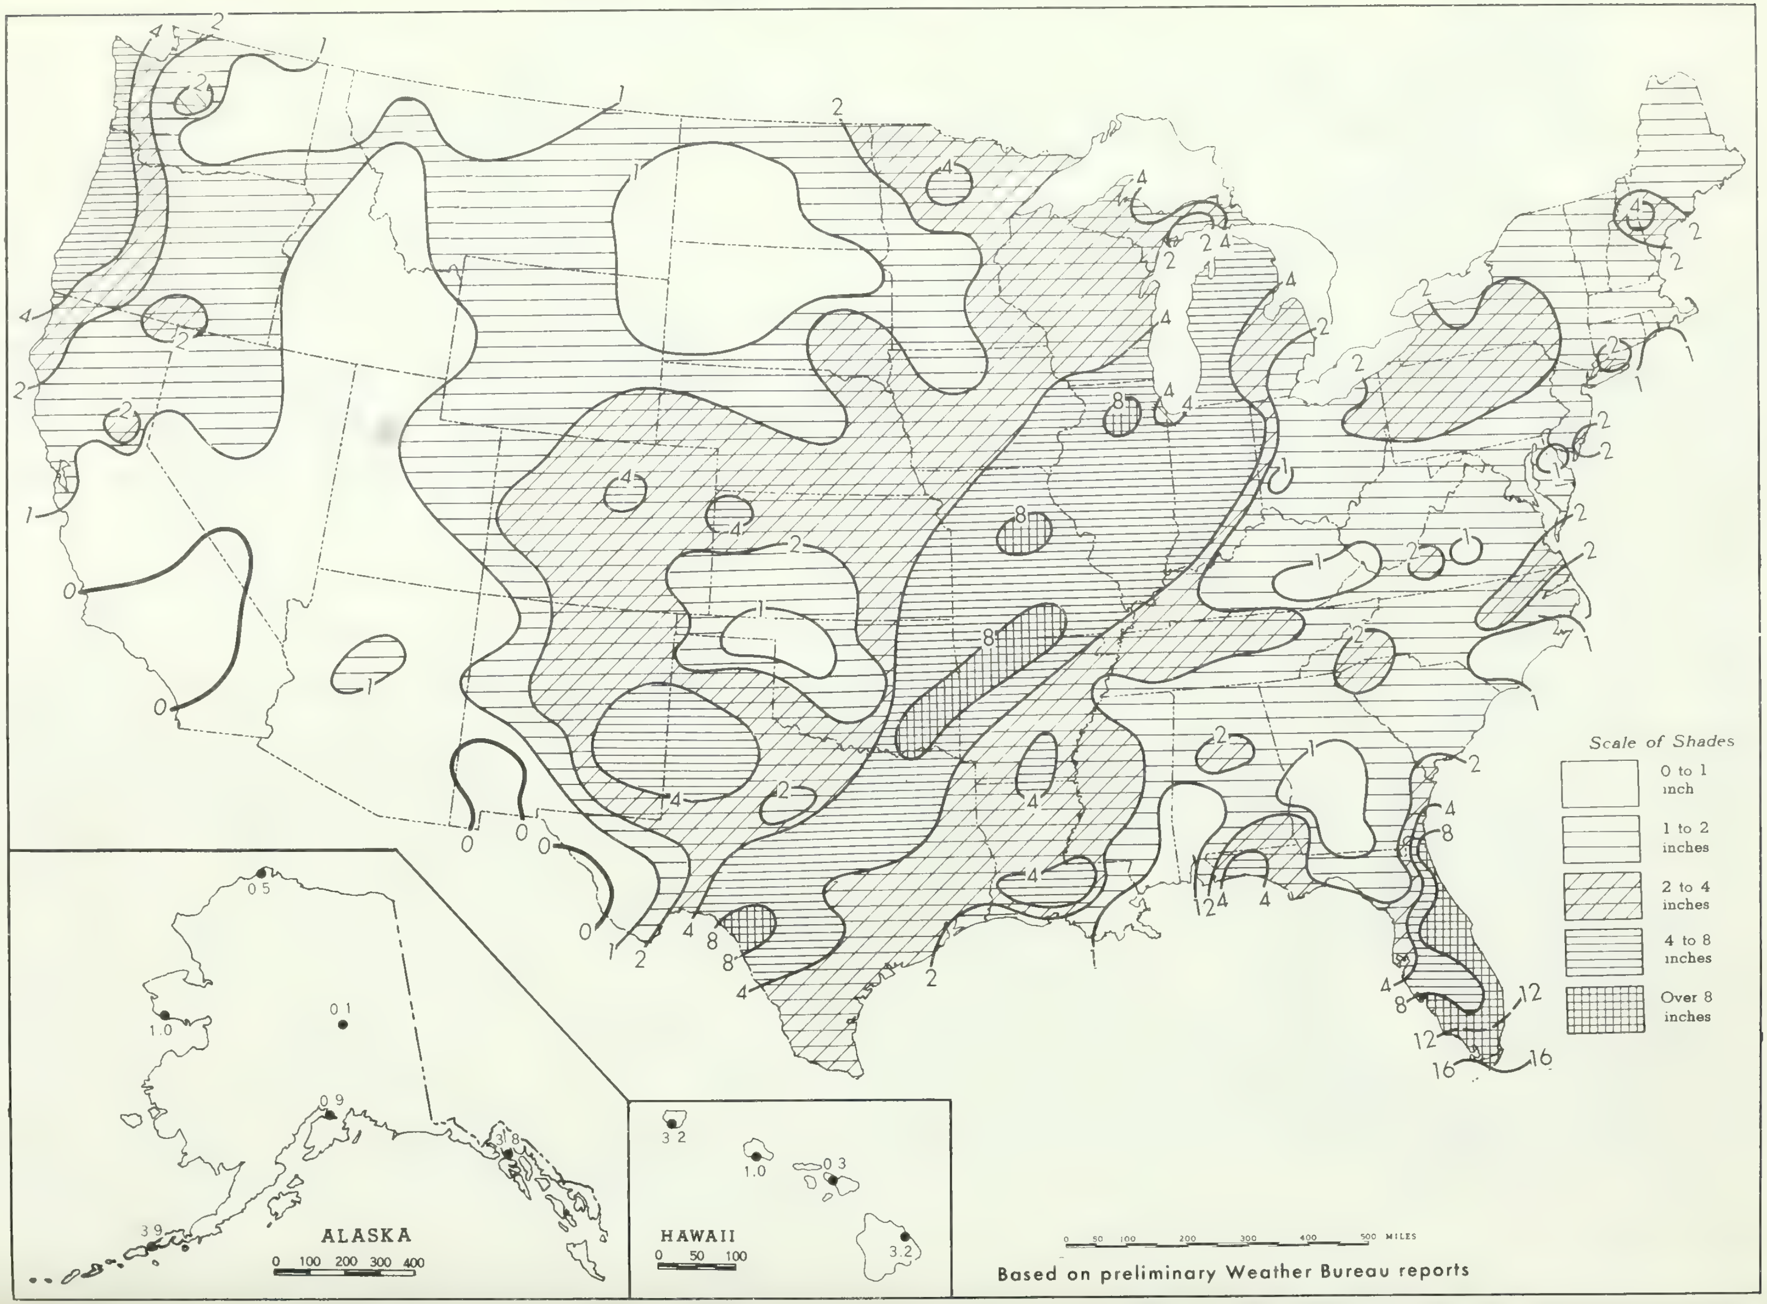

Chart III. Percentage of Normal Precipitation, October 1969.

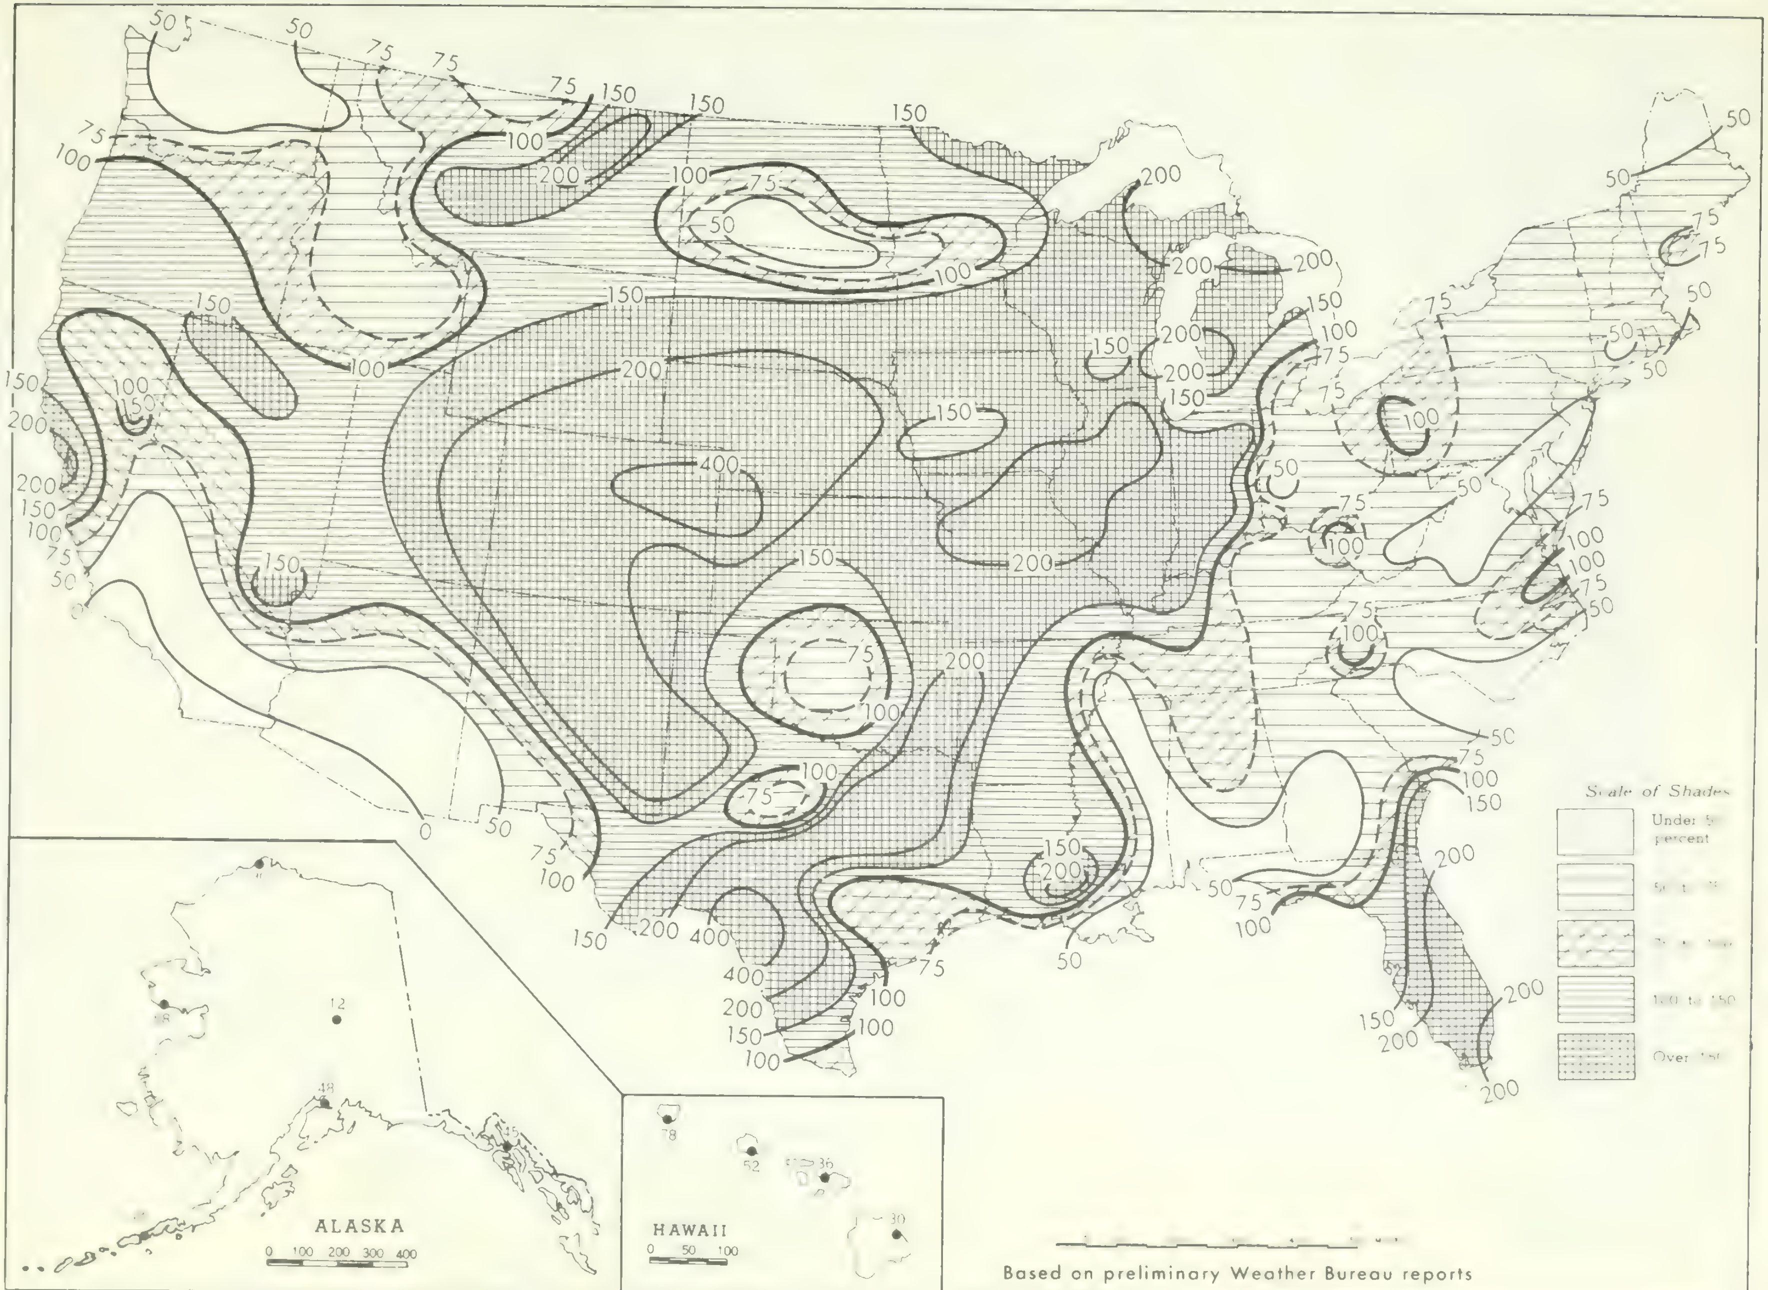

Chart VI. A. Percentage of Possible Sunshine, October 1969.

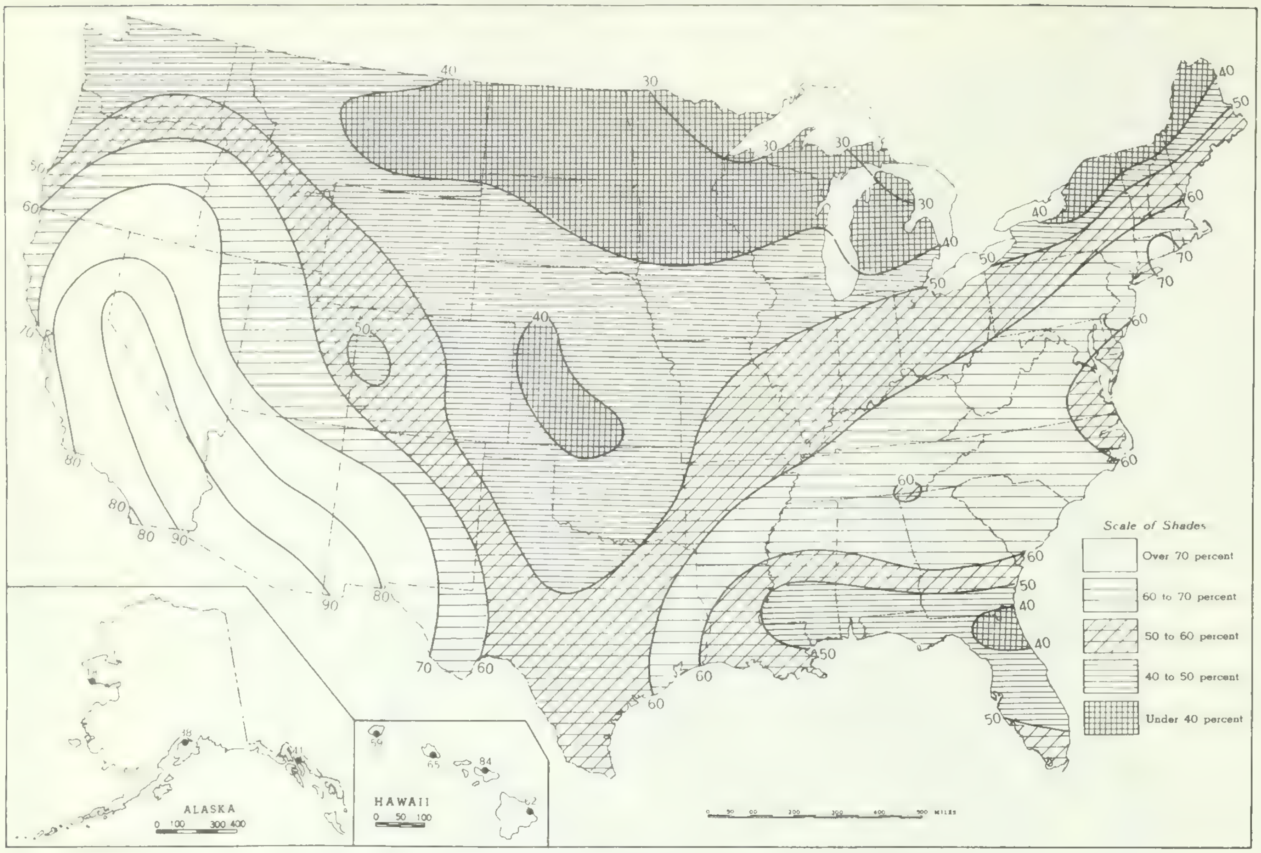
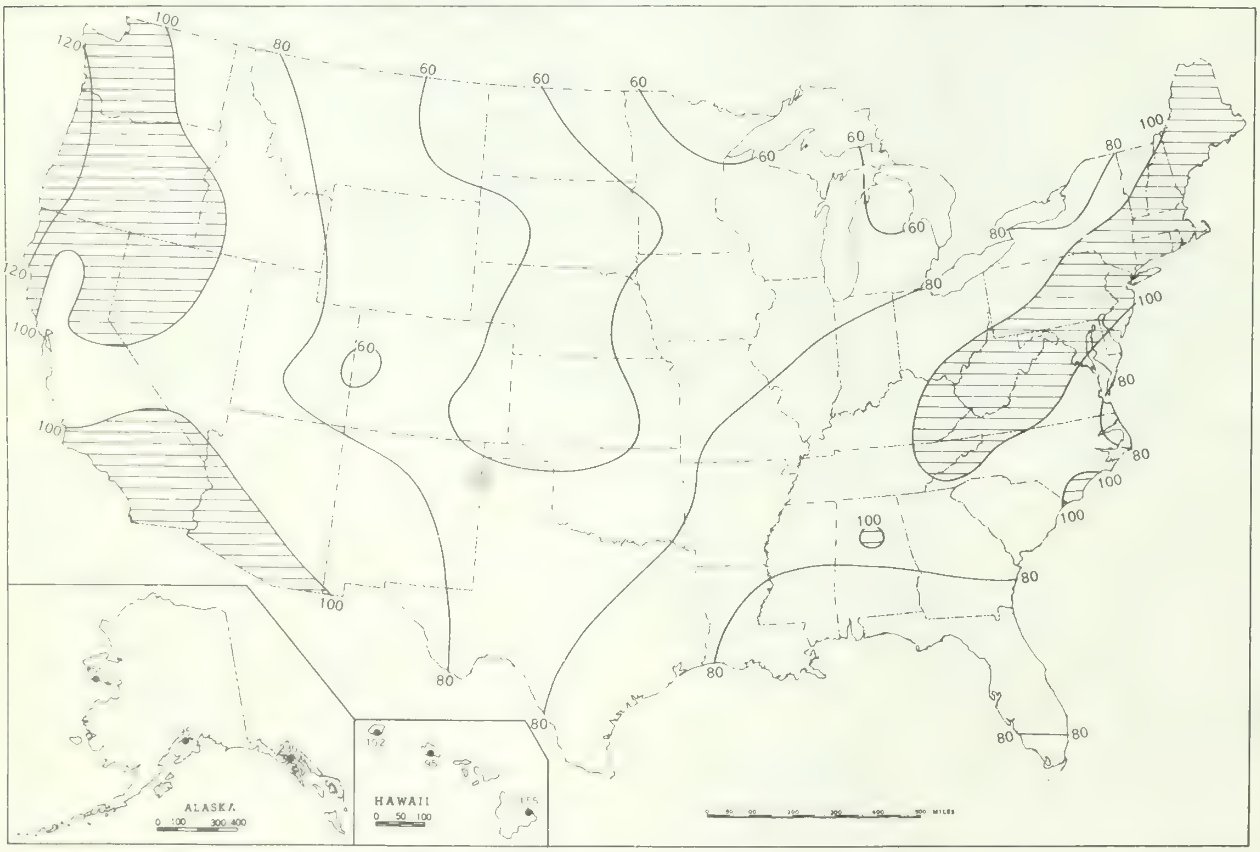
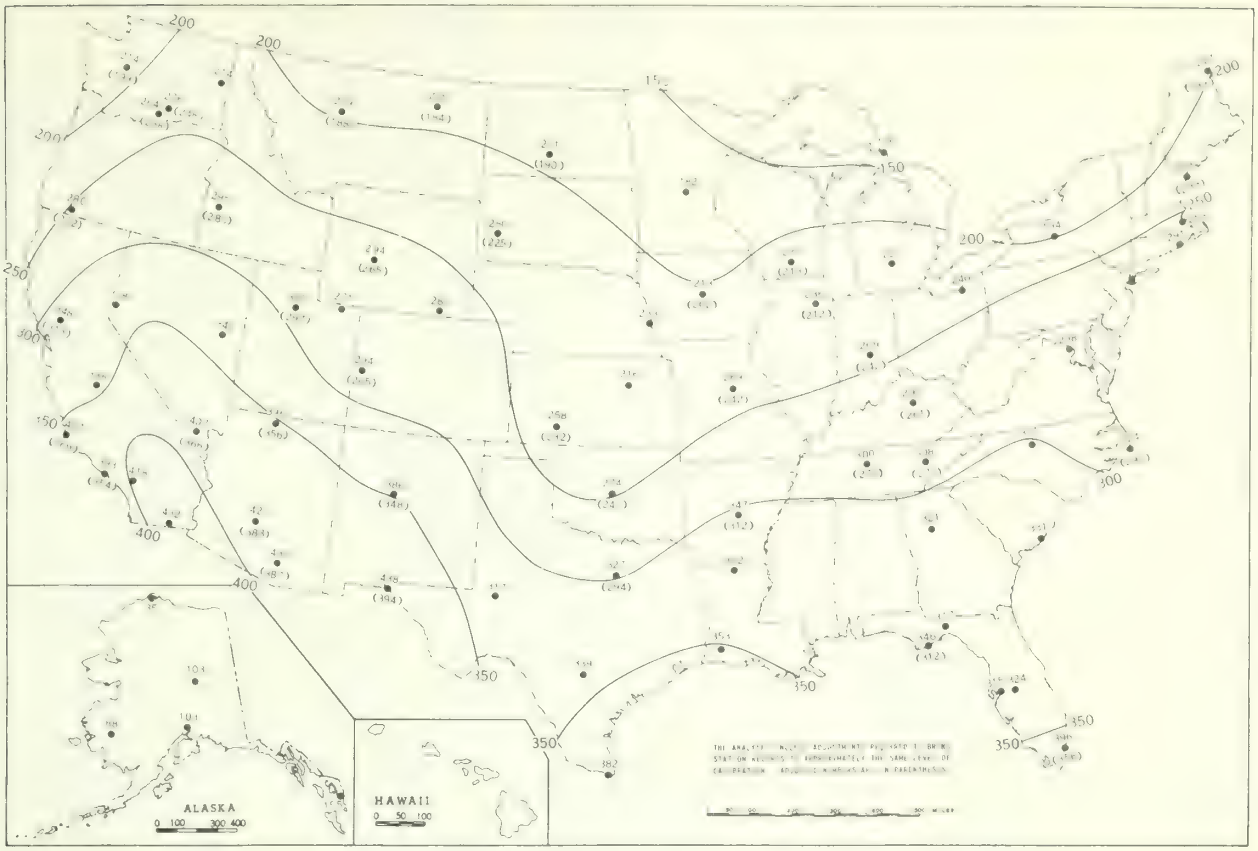


B. Percentage of Mean Monthly Sunshine, October 1969.

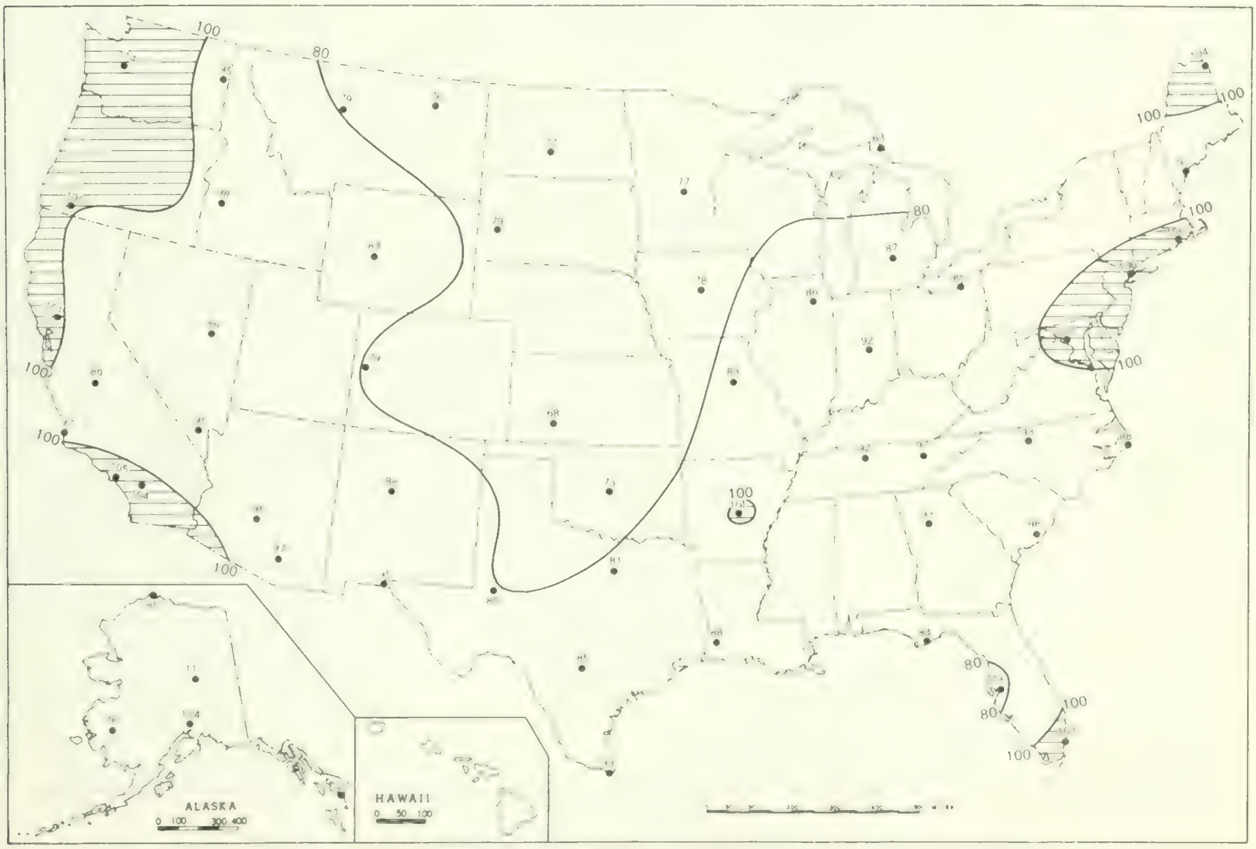


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, October 1969.

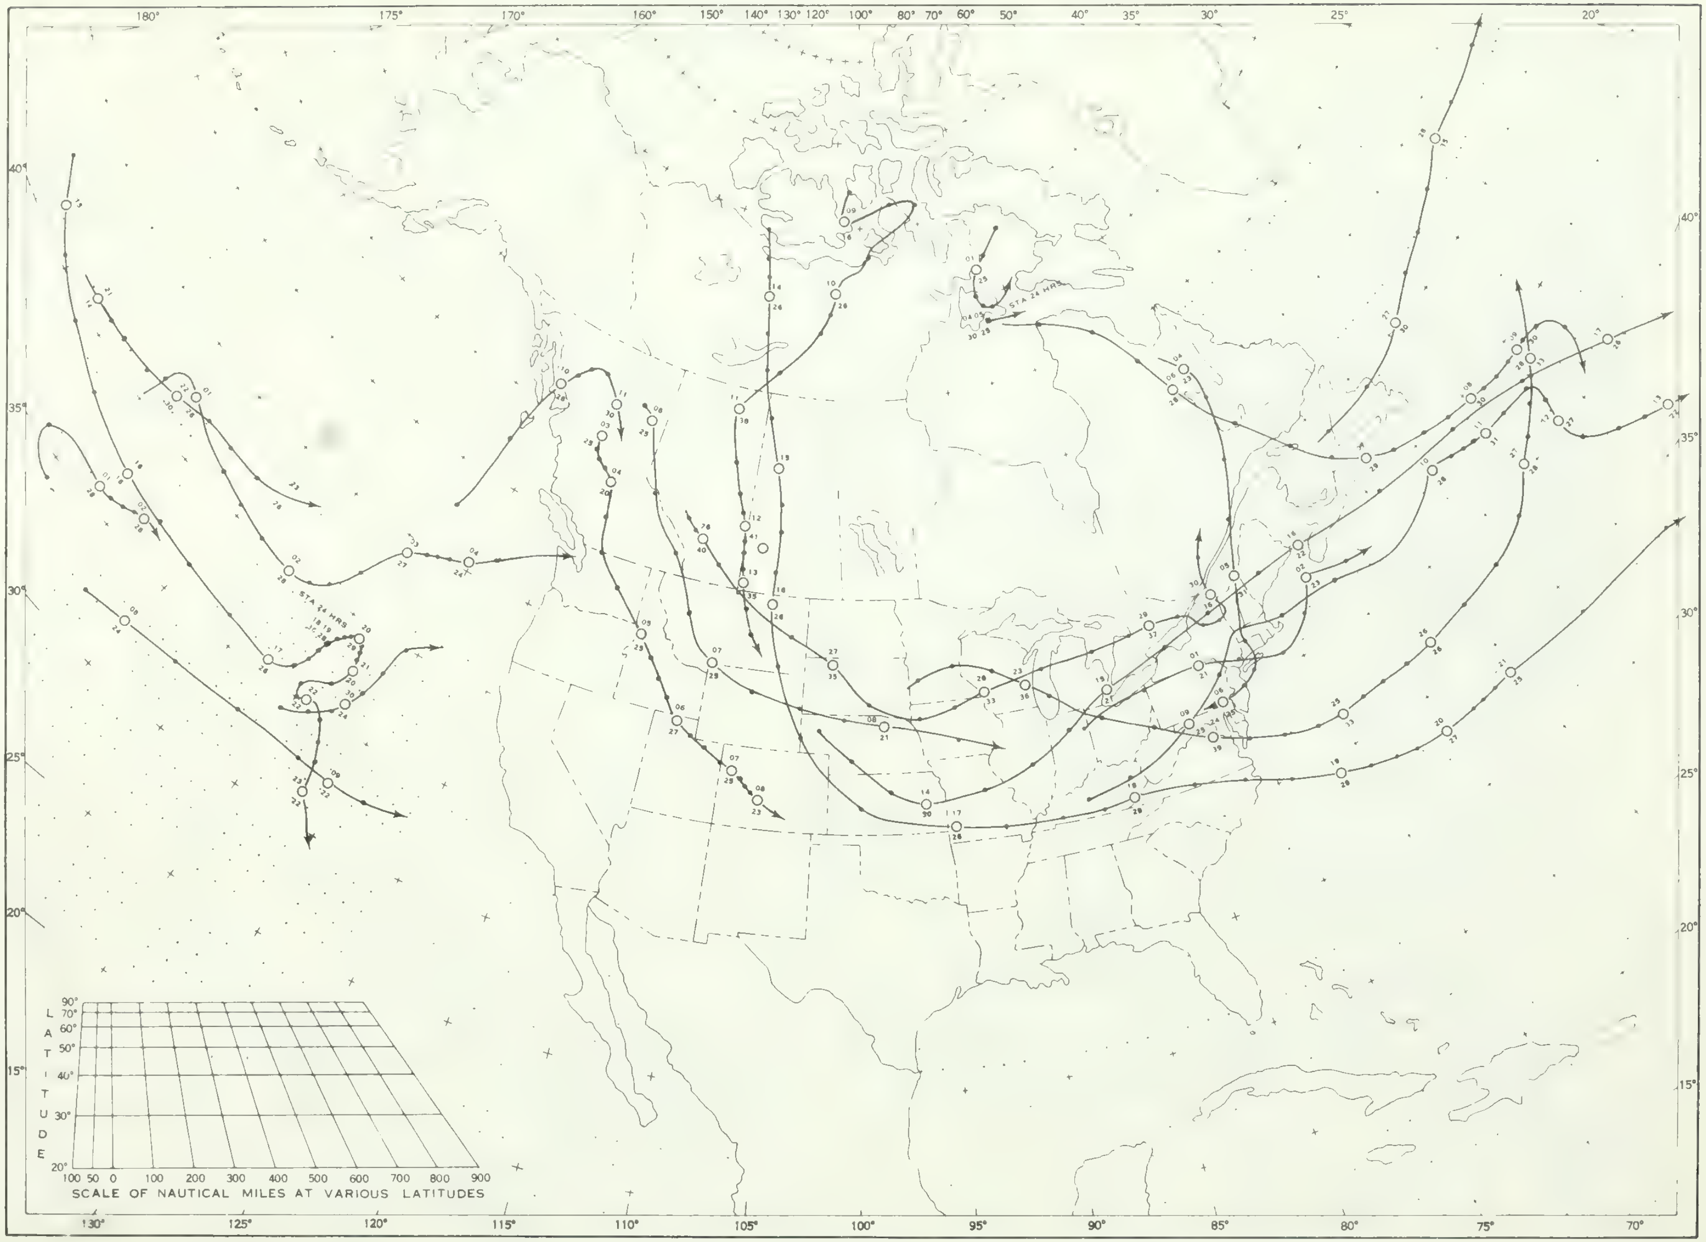


B. Percentage of Mean Daily Solar Radiation, October 1969.



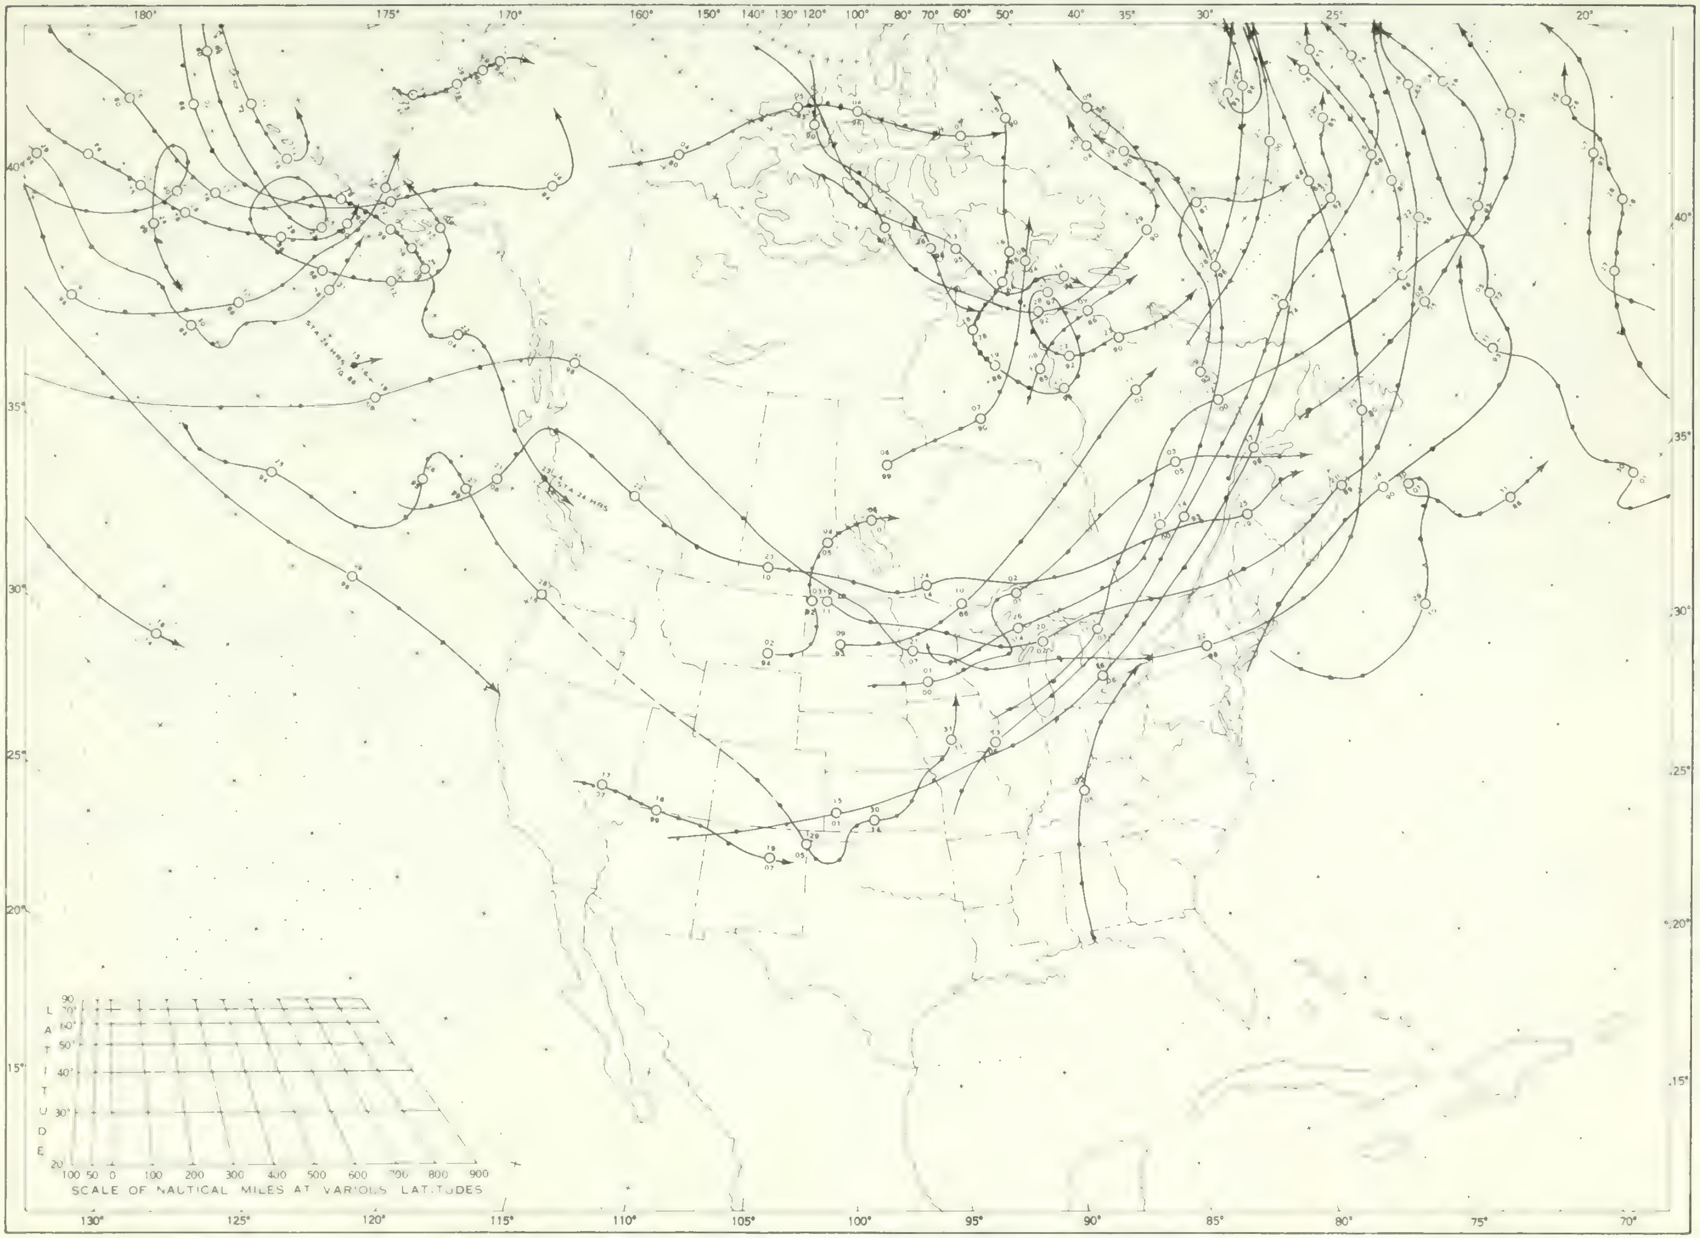
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm. $^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII Tracks of Centers of Anticyclones at Sea Level, October 1969.



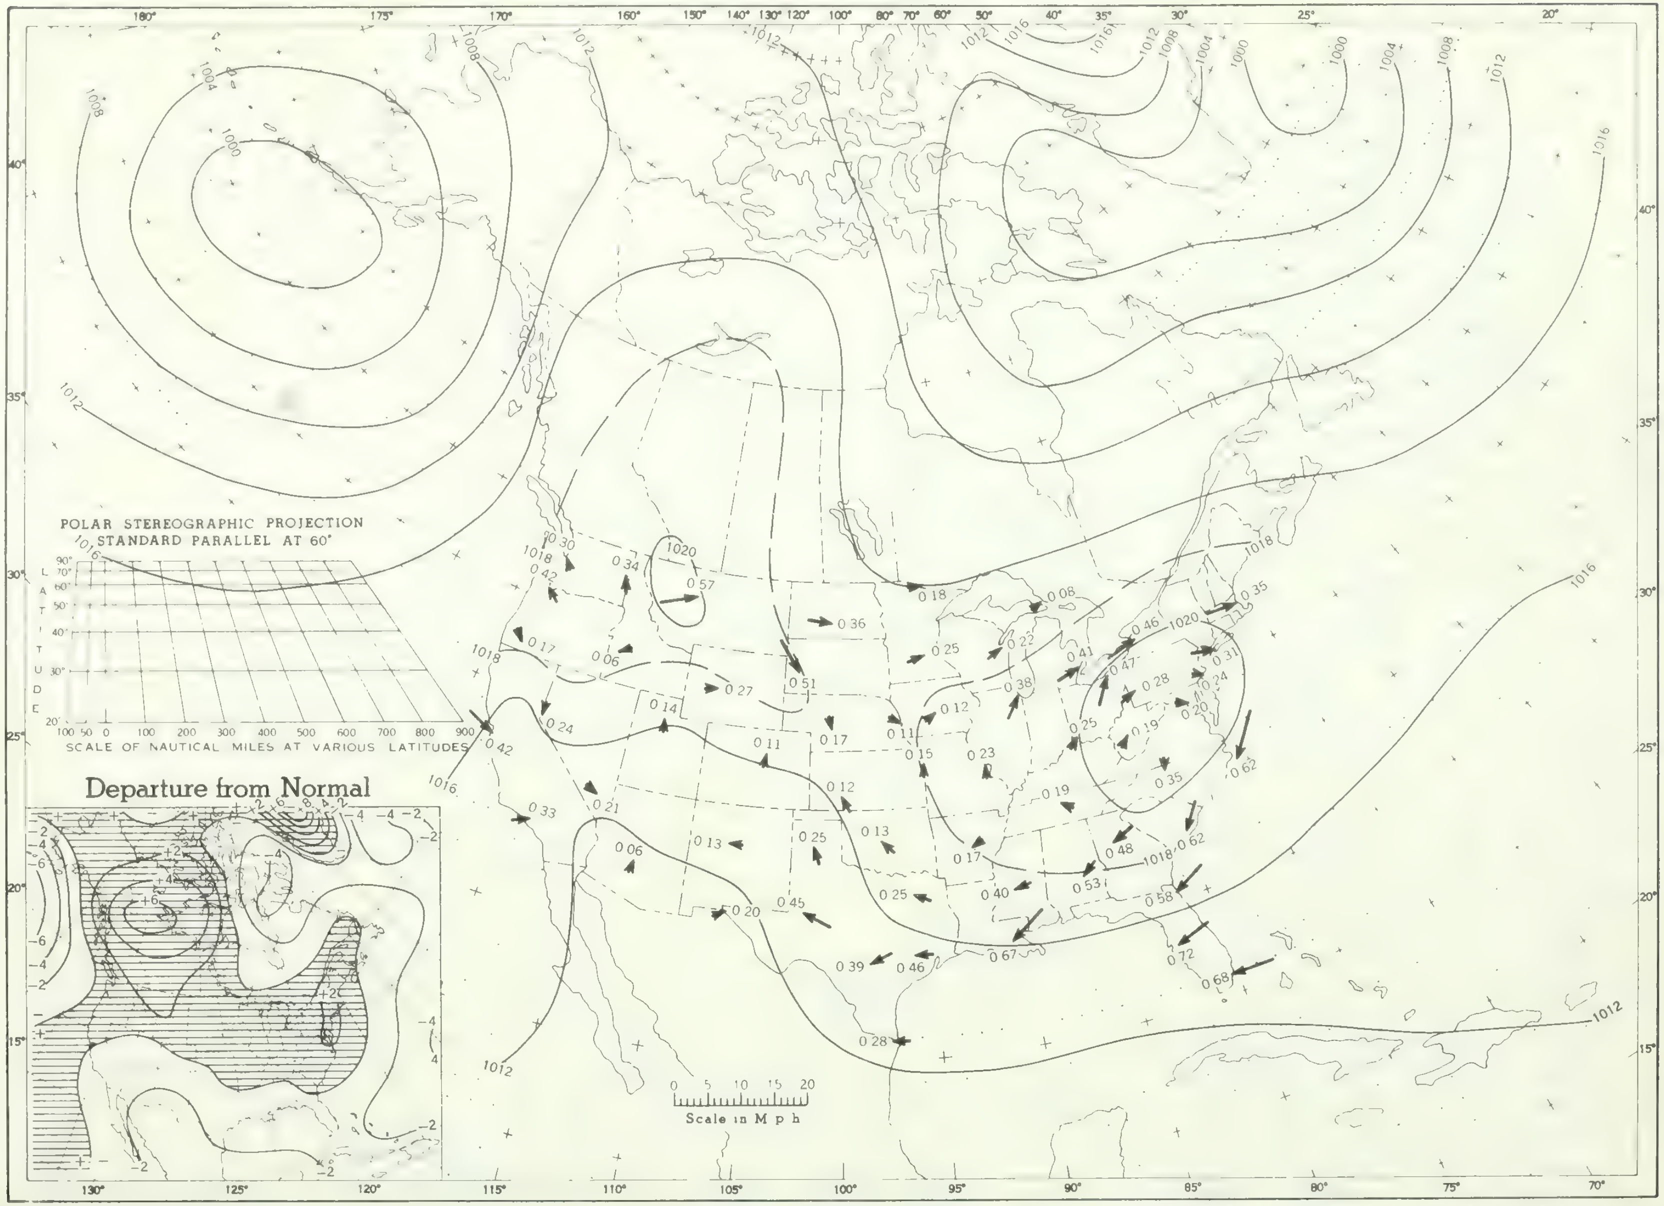
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX   Tracks of Centers of Cyclones at Sea Level, October 1969.



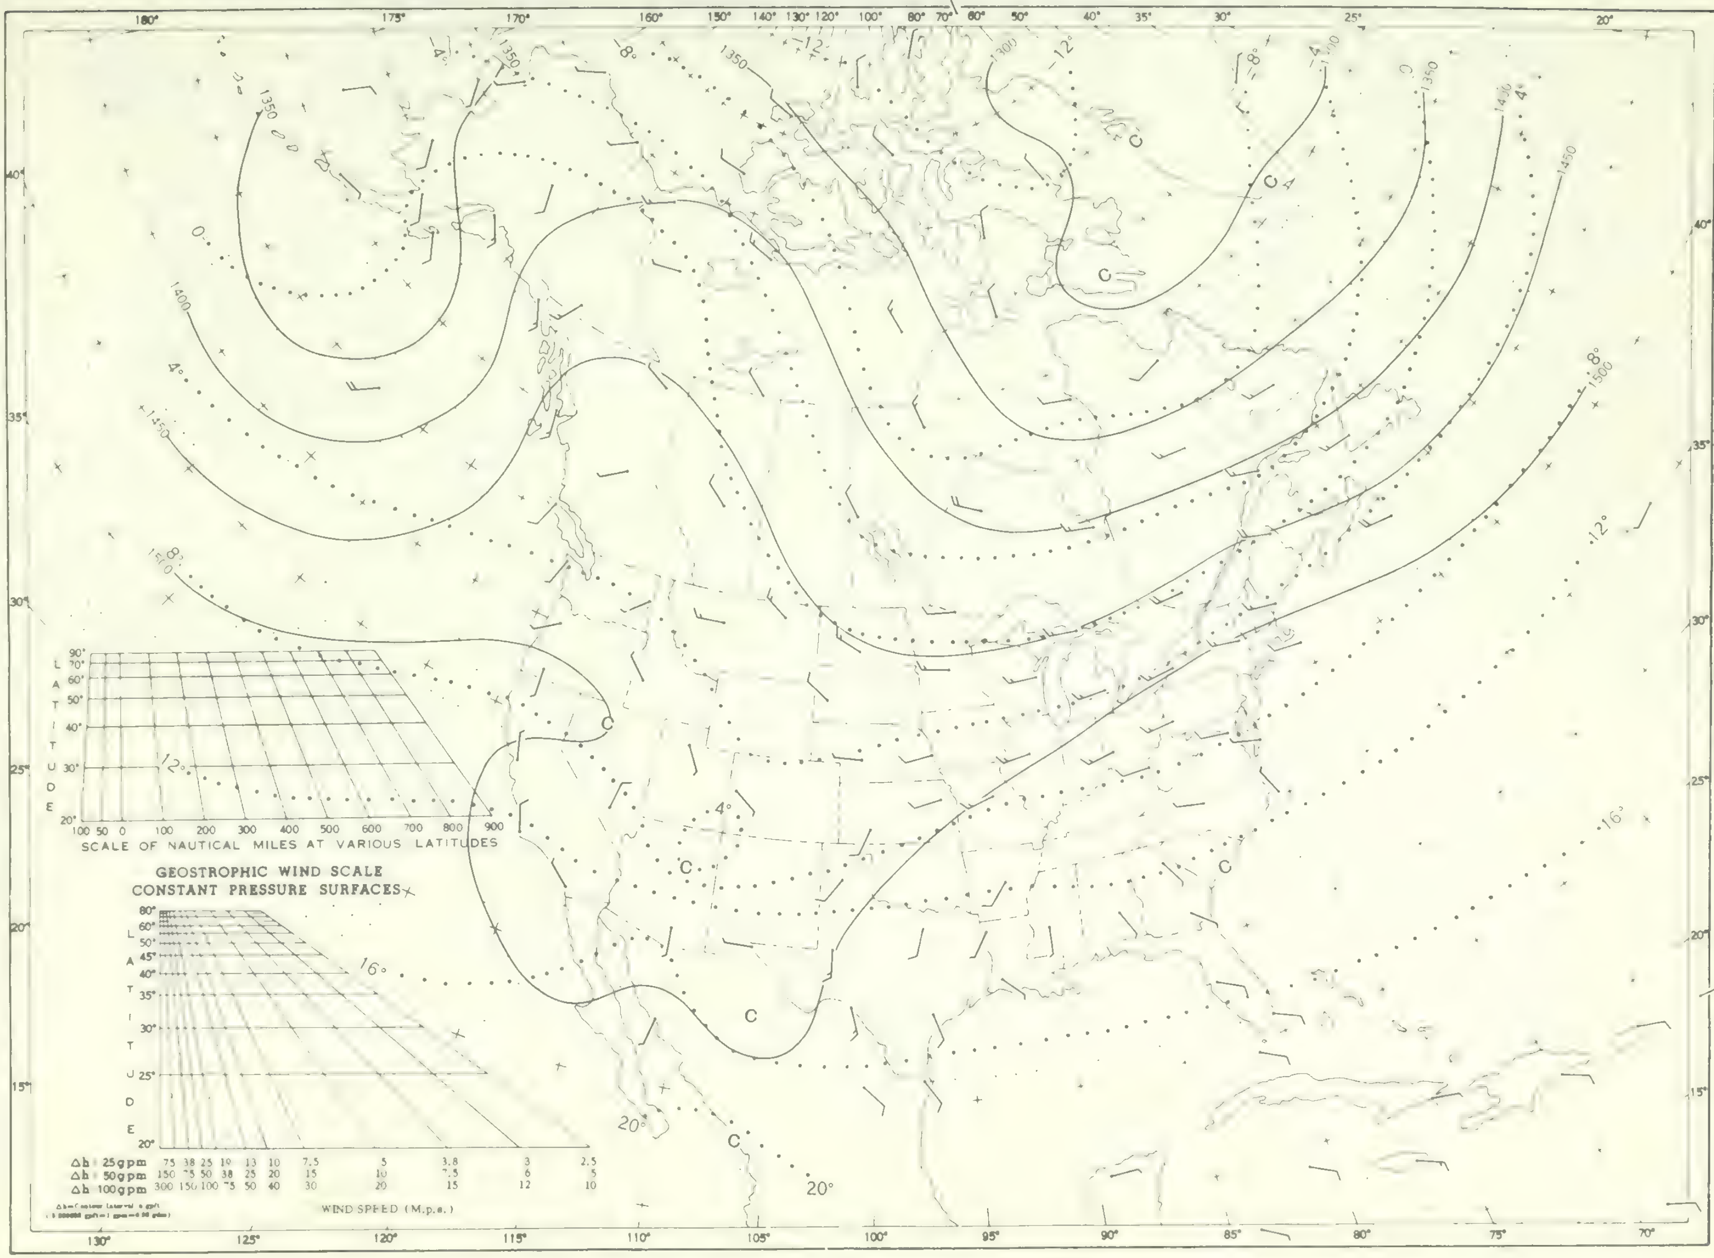
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, October 1969. Inset. Departure of Average Pressure (mb) from Normal, October 1969.



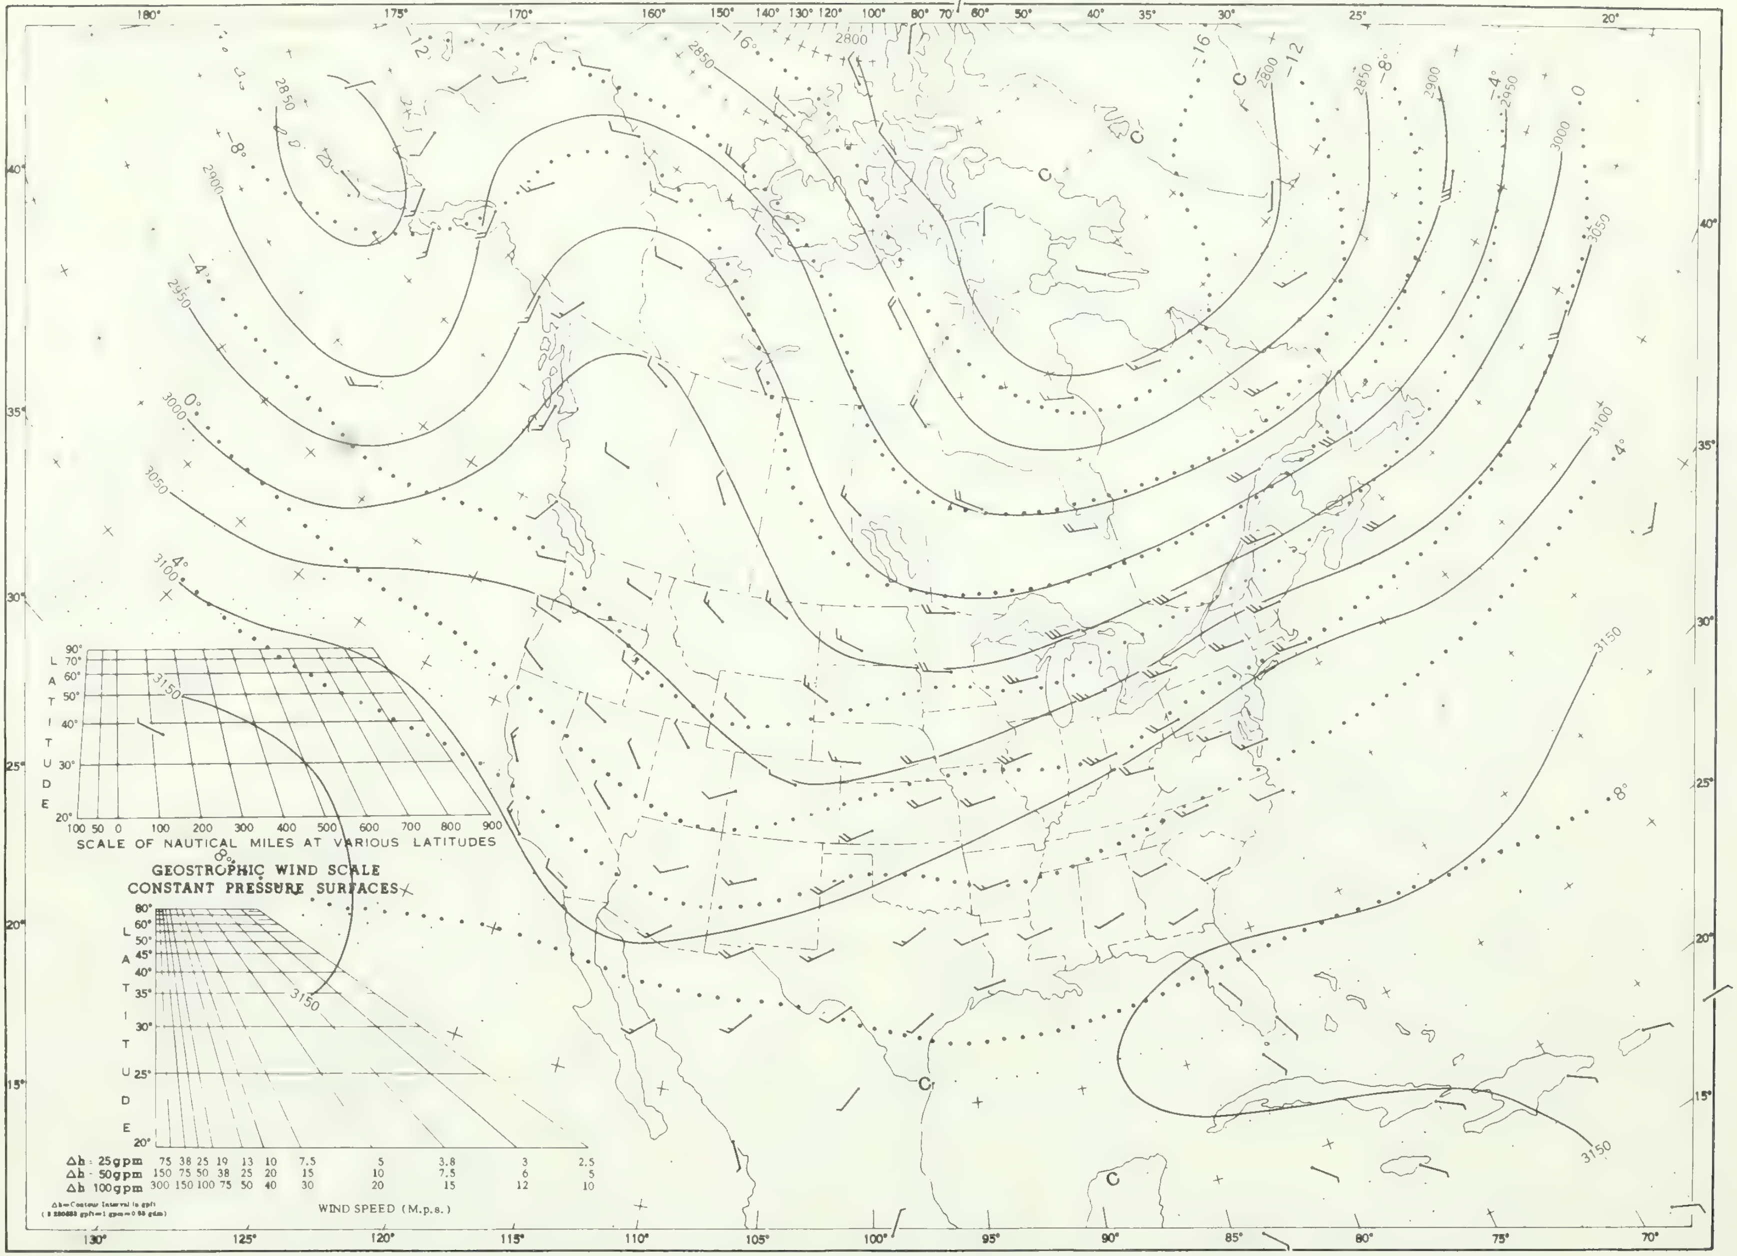
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb Surface, 1200 GMT, **October 1969**. Average Height and Temperature, and Resultant Winds.



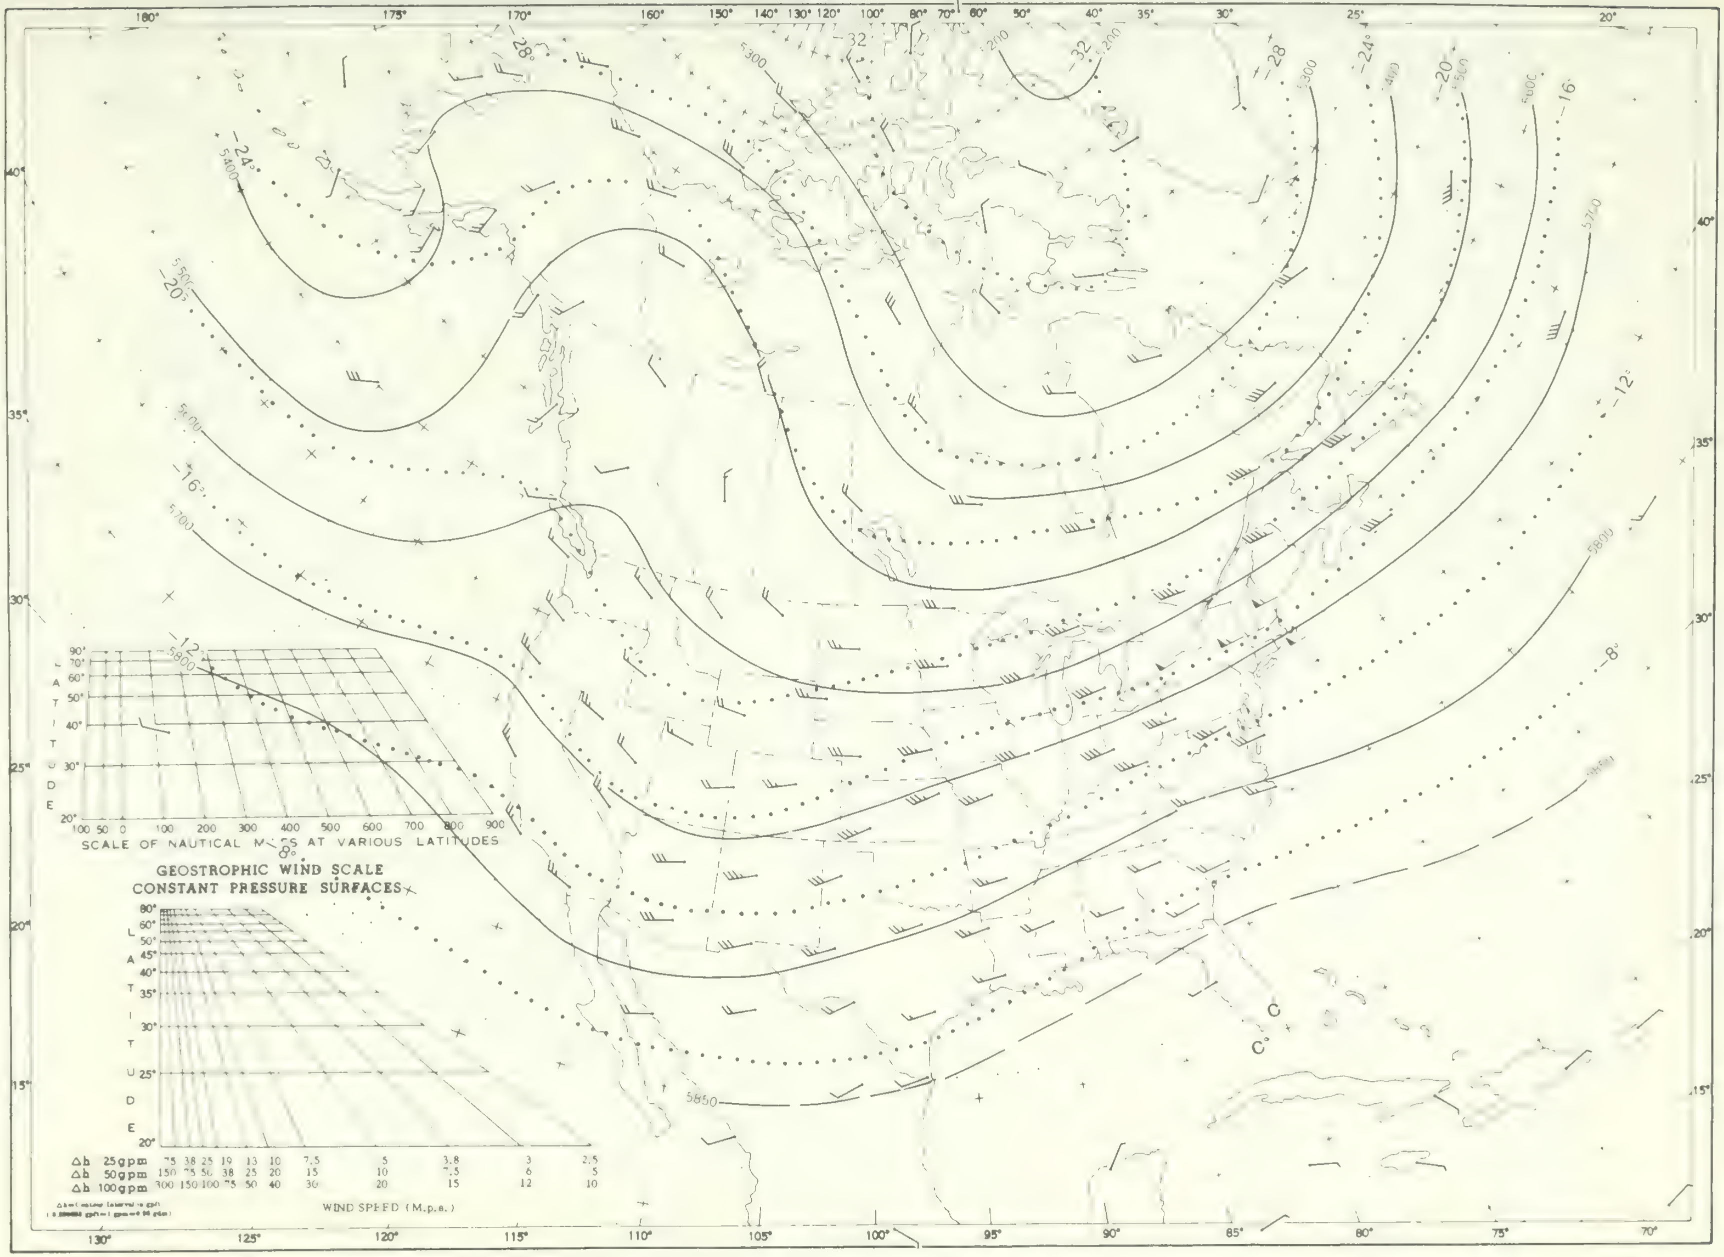
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 GMT, October 1969. Average Height and Temperature, and Resultant Winds.



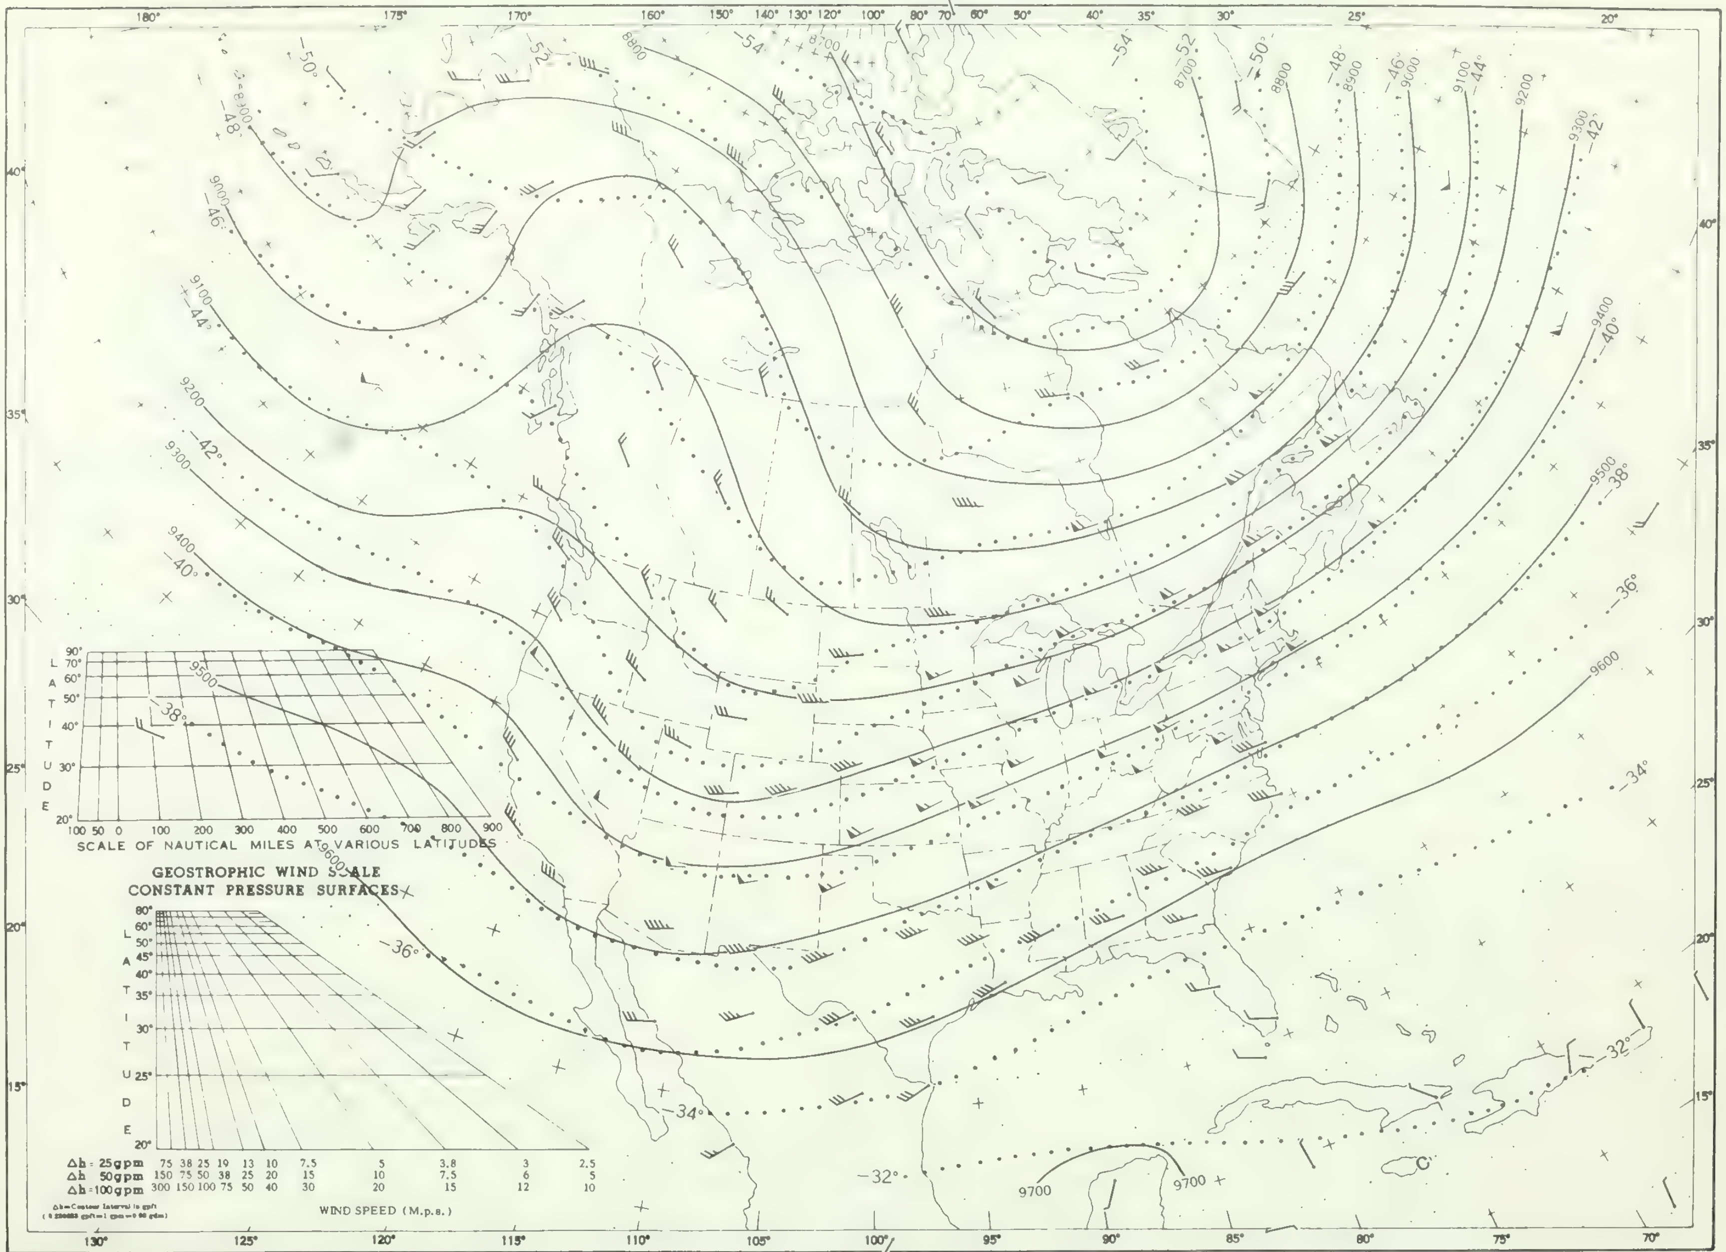
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII. 500-mb Surface, 1200 GMT, October 1969. Average Height and Temperature, and Resultant Winds.



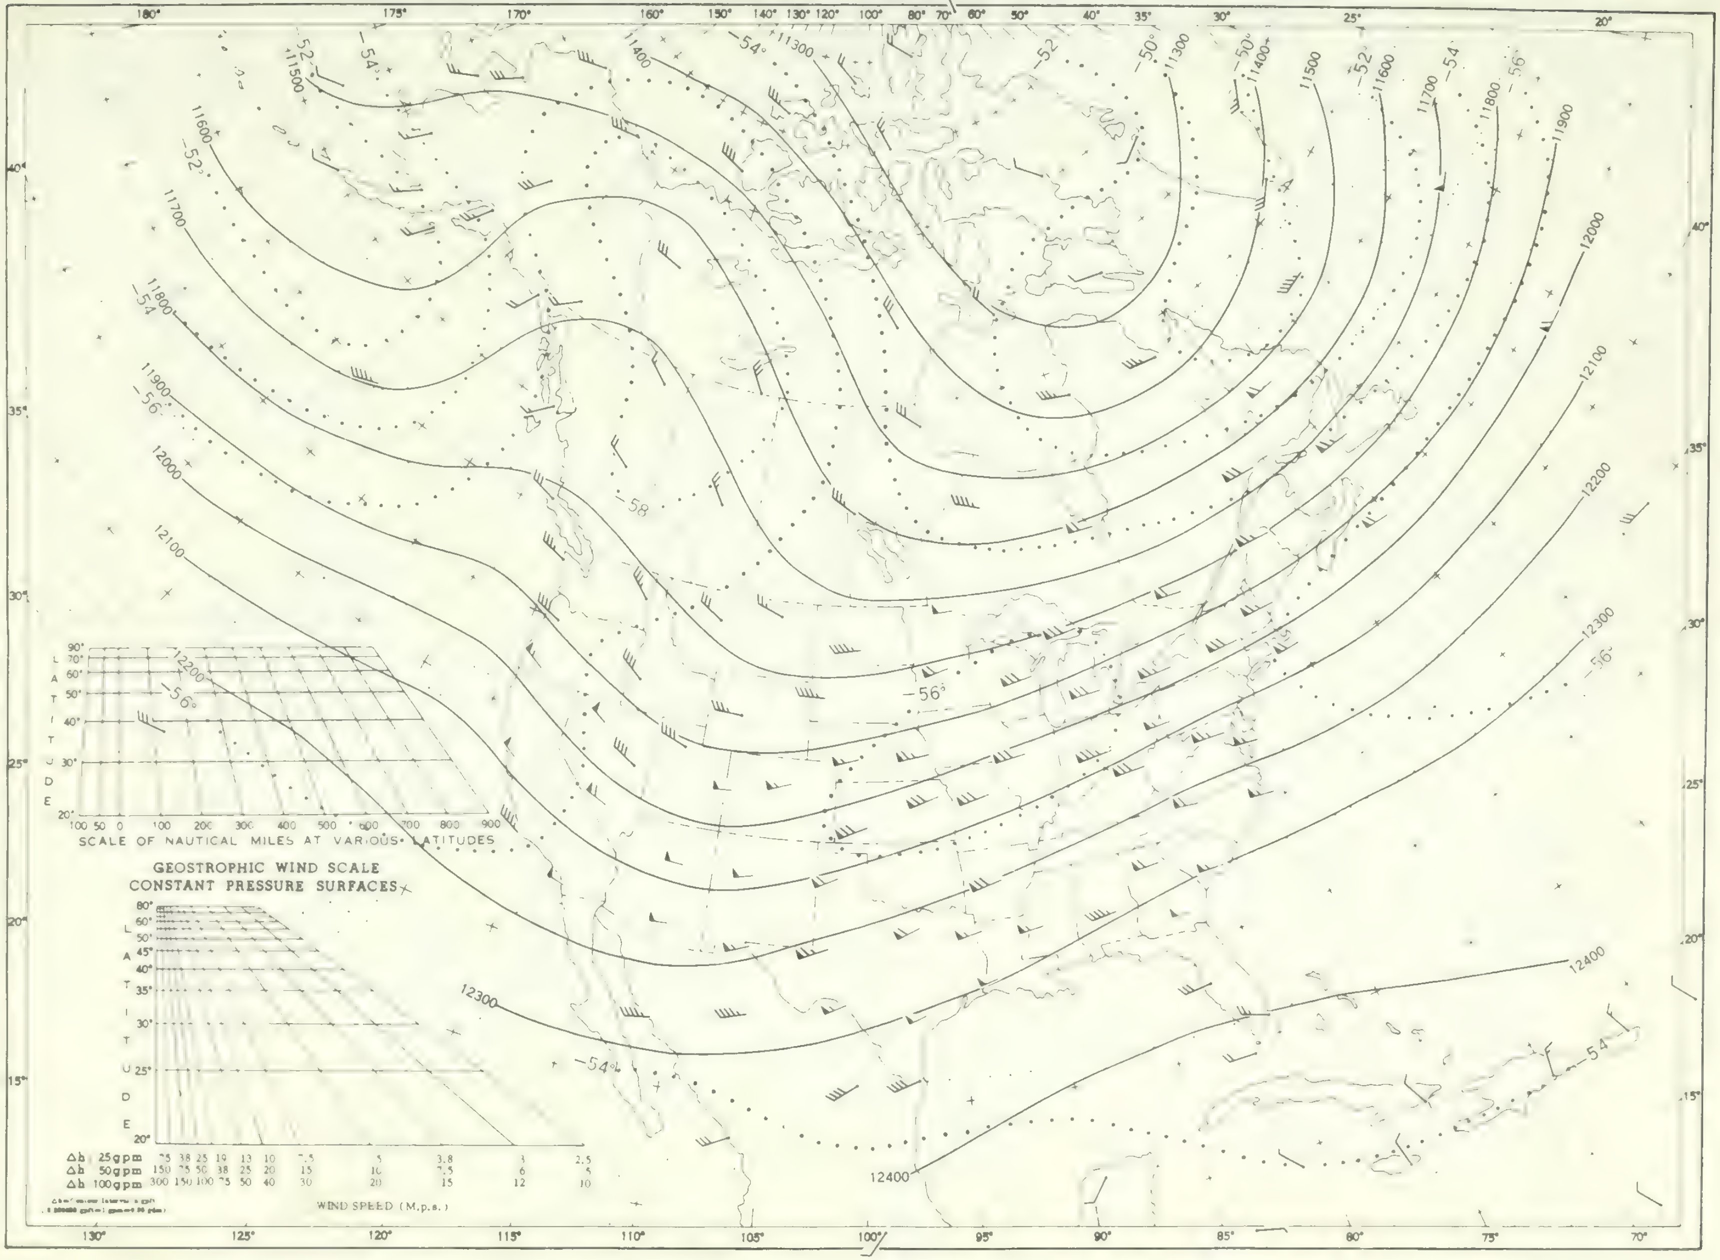
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV. 300-mb. Surface, 1200 GMT, October 1969. Average Height and Temperature, and Resultant Winds.



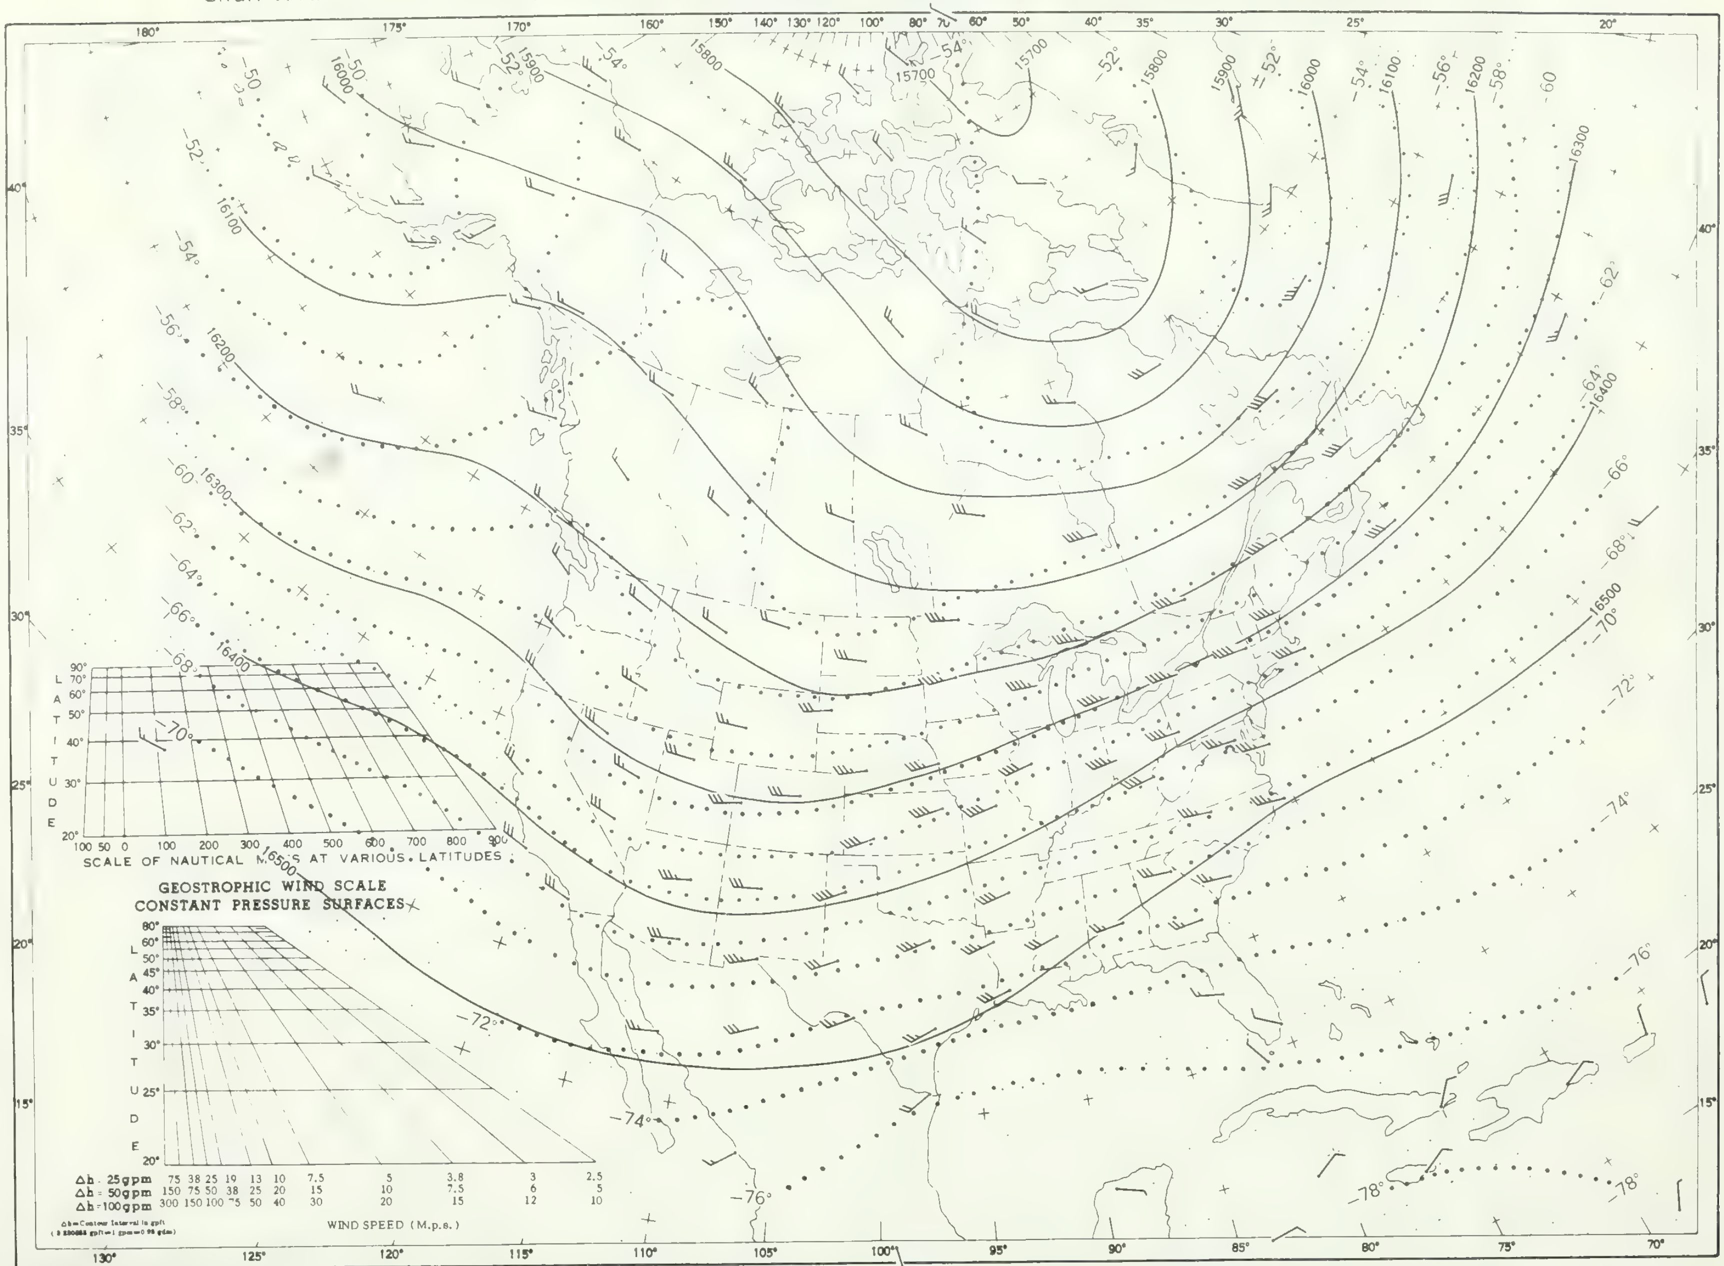
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25mps, full feather 5mps, and half feather 2.5mps. All wind data are based on rawin observations.

Chart XV. 200-mb. Surface, 1200 GMT, October 1969. Average Height and Temperature, and Resultant Winds.



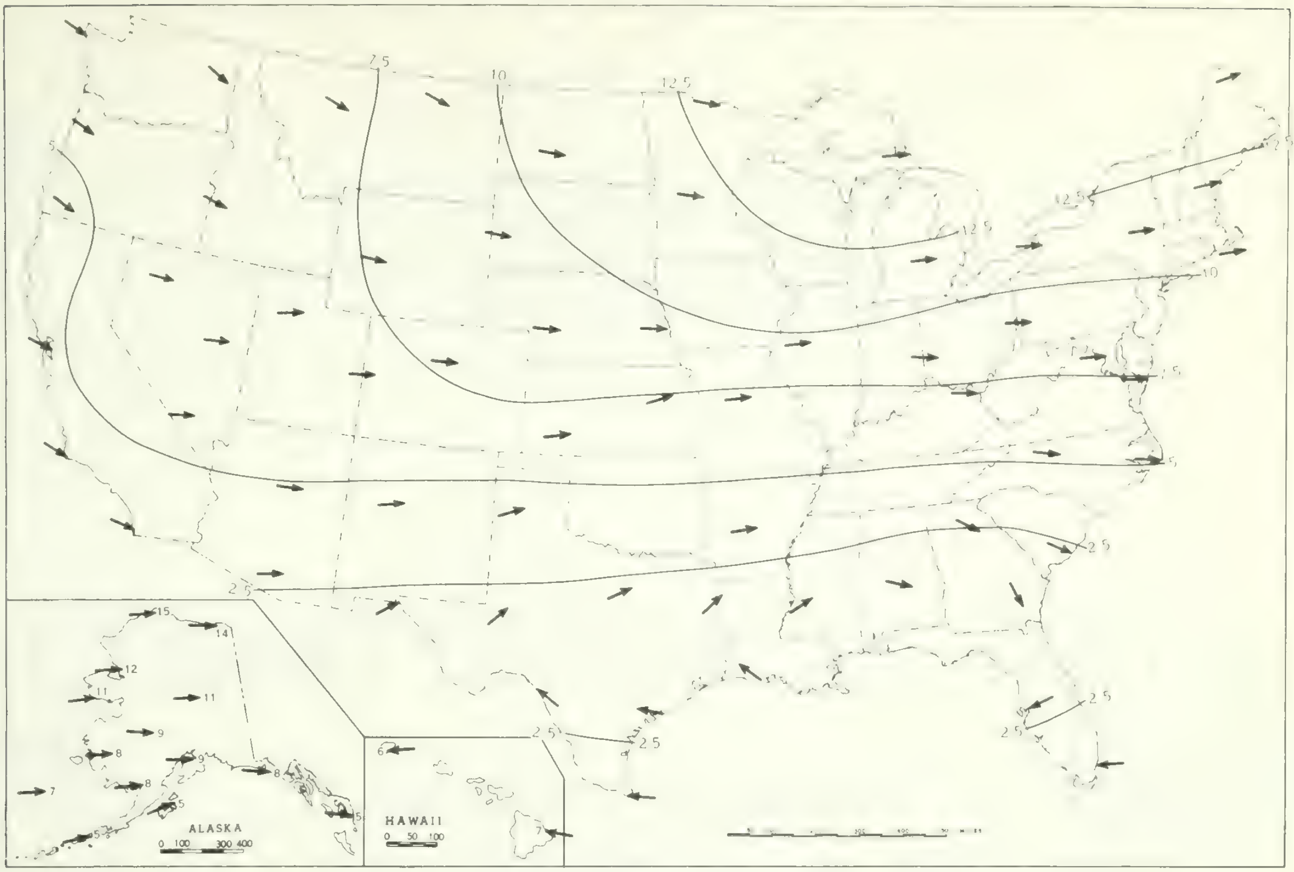
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI. 100-mb. Surface, 1200 GMT, **October 1969**. Average Height and Temperature, and Resultant Winds

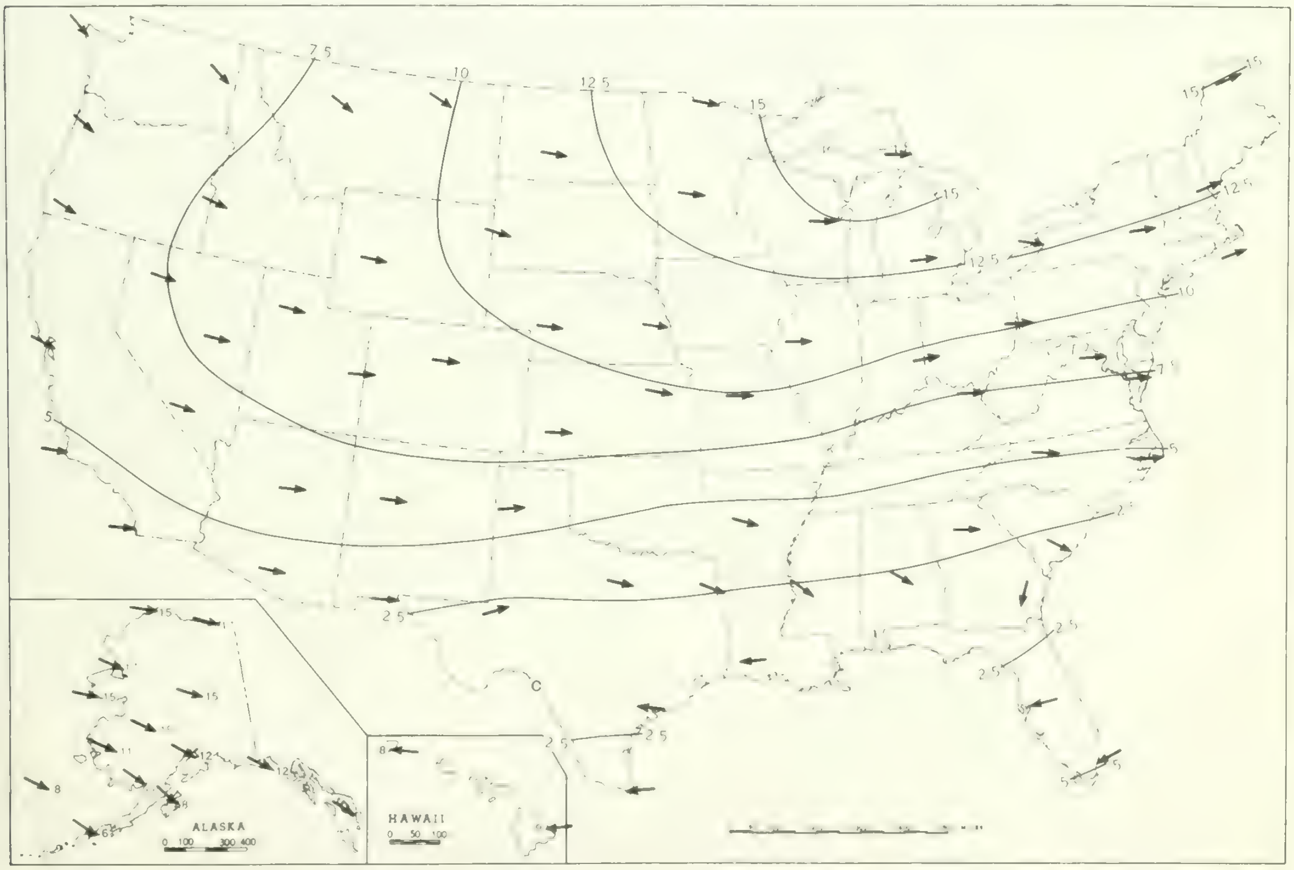


Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 GMT, October 1969. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, October 1969. Resultant Winds.



Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

CONTENTS

NOTE: Delayed data and corrections will be carried in the June and December issues of this publication. An explanatory page "Description of Charts" will be carried in the January and July issues.

SUBSCRIPTION PRICE: Monthly 20 cents and annual 40 cents per copy; yearly subscription, including monthly and annual issues, $2.50 domestic, $3.50 foreign. Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to "Superintendent of Documents, Government Printing Office, Washington, D.C. 20402"

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 20 No. 11 NOVEMBER 1969

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Temperatures averaged above normal over most of the West and below normal over most of the East.
2. Most of the northwestern two-thirds of the Nation received less than an inch of rain.
3. The first half of the month was especially rainy in the Northeast.

TEMPERATURE.--In general, temperatures averaged above normal from the Pacific Ocean to the northern and central Great Plains and below normal from Texas to Lower Michigan and eastward to the Atlantic Ocean. Much of the northern Great Plains averaged 4° to 7° warmer than normal. A narrow strip from southern Ohio to the western part of the Florida Peninsula averaged 3° to 5° cooler than normal.

The month began with warm weather in the Southwestern States and wintry weather along the eastern slopes of the Rockies and the western portion of the central Great Plains. A polar high pushed the freezing line far southward into Mississippi, Alabama, and the western portion of the Florida Panhandle in the first week of the month. Tallahassee, Fla., registered 32° on the morning of the 5th. On the same day, quick warming in the western Great Plains pushed afternoon temperatures into the 70's, with Miles City, Mont., and Dickinson, N. Dak., registering 72°. High pressure, fine weather, and near-normal temperatures prevailed from coast to coast early in the second week of November. Afternoon temperatures reached the 40's and 50's across the northern portion of the Country, and the 70's and 80's across the southern portion. However, considerable fog lay over parts of the Central and East. A change in circulation pushed the fog and pollution from the Central and East and brought dry arctic air into Montana. By the 14th, the leading edge of the cold air had reached the Gulf of Mexico and by the next day, temperatures in northern Florida had tumbled into the 20's. A hard freeze occurred over much of the Deep South. Some areas from Alabama to North Carolina had never been so cold so early in the season. Mild weather lingered only along the southern Atlantic seaboard. The 14th was sunny but cold over most of the Nation. Blustery winds sharpened the bite of the cold. Shortly after midmonth southerly winds brought quick warming to the southern Great Plains and to the eastern half of the Nation. Oklahoma City, Okla., warmed to 70° on the 15th; the highest temperature on the 14th was 42°. At the same time a fresh supply of cold, dry, arctic air moved into the northern Great Plains. The cold air spread southward quickly and soon a strong cold front stretched across the Nation from north to south separating two air masses that differed widely. To the east lay warm, moist, Gulf air. Cold, dry, arctic air covered the northern and central Great Plains west of the front. At noon on the 17th, Concordia, Kans., in the cold air, registered 37° and Topeka, in the warm air about 100 miles east of Concordia, registered 70°. As the front moved rapidly eastward, temperatures dropped quickly--aften 10° to 15° within an hour. By noon on the 19th, only the Atlantic seaboard lay in the warm air. Subfreezing temperatures occurred as far south as the Gulf coast. Temperatures from Lake Charles to New Orleans, La., dropped from near 80° on the 18th to below freezing by the morning of the 24th. Subzero temperatures occurred in the Red River of the North Valley, and thin ice formed at some places in the northernmost Great Lakes. Temperatures dropped to below zero in the central Rocky Mountains, also.

A huge High followed the front. It brought clearing skies and temperatures rose quickly west of its center. Sidney, Nebr., which had been no warmer than 28° on the 18th, warmed to 60° by the afternoon of the 21st. The warming trend spread eastward, and sunny, pleasant weather covered most of the Nation in the last week of November. The month ended with mild temperatures from the Southwest to the northern Great Plains and along the east Gulf and south Atlantic coasts, and below-normal temperatures in the Northwest and from New Mexico and Texas to New England.

PRECIPITATION.--November rainfall ranged widely along the northern Pacific coast, from 3 to over 8 inches. A short distance inland, the totals ranged from 1 to 3 inches. Most of the area from California to the upper and middle Mississippi River received less than 1 inch. Central and eastern Texas and most of the area east of the Mississippi River received 1 to 4 inches. Totals exceeded 4 inches from Shreveport, La., to Memphis, Tenn., and 8 inches along the coast from Portland, Maine, to Boston, Mass.

Gale winds accompanied torrential rains along portions of the Atlantic coast early in November. Jacksonville, Fla., received 5.47 inches, over 3 times the November normal, in the 24-hour period ending at 7 a.m., November 1, and over 7 inches fell at Myrtle Beach, S. C., in 6 hours late that evening. By the middle of the first week of November, rains were soaking the north Pacific coast. Snow fell above 5,000 feet in the mountains from Washington to northern California and eastward to northern Montana. Heavy rains also fell in much of the Northeast. Some wet snow was mixed with the rain in northern Indiana and northern Ohio, and the southern Appalachians received their first snow of the season on the 4th. Precipitation continued in parts of the Northeast for 13 consecutive days, the longest such period of record at some locations. About midmonth, heavy snow, driven by strong winds, closed mountain highways in Colorado, and heavy squalls dumped 6 to 14 inches of snow in the lee of the Great Lakes. Snow accumulated to 10 inches in the La Porte and South Bend, Ind., area to about 14 inches at Holland and 12 inches at Hancock in Michigan, and to 6 to 10 inches in New York near Lake Erie. Niagara Falls, N. Y., received 6 inches of snow in 1 hour on the evening of the 15th. About 5 inches fell in the mountains of Kentucky, Virginia, and North Carolina and up to 11 inches in West Virginia. Meanwhile, another winter storm moved into the northern Rocky Mountains. By the evening of the 16th, 11 inches of snow lay on the ground at West Yellowstone, Mont.

In the third week of November, heavy rains occurred in connection with a powerful, eastward-moving cold front that stretched from north to south across mid-America. Southerly winds brought mild, moist air

northward ahead of the front. Northerly winds pushed frigid arctic air southward west of the front. Cloudiness increased and rain fell ahead of the front. A few thunderstorms occurred in the warm, moist air. By the 18th, rains covered a belt about 300 miles wide and extending from the Great Lakes to the Gulf of Mexico. As the front approached, snow became mixed with rain in the northern and central sections. Snow fell in the cold air after the frontal passage followed by clearing skies. Storm totals ranged from 2 to more than 4 inches from northeastern Texas to northwestern Ohio. Cold air picked up moisture as it crossed the Great Lakes and deposited heavy snow on the lee side of the Lakes. Light snow fell from the northern Rockies to the Great Lakes and in the Appalachians, and moderate to heavy snow in the Cascades and Olympic Mountains.

Light rain fell across the Southland and along the Atlantic coast, and heavy showers in southern Texas in the last week of November when wide areas from the Pacific Ocean to the Ohio River Valley received no rain or only light sprinkles.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70°F. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

V Sun below horizon November 19 - 30, inclusive.
X Sun below horizon November 24 - 30, inclusive.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

V Sun below horizon November 19 - 30, inclusive.
X Sun below horizon November 24 - 30, inclusive.

See footnotes at end of table

° Includes crop damage
C Crop damage

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
# Freezing drizzle and freezing rain, commonly known as glaze.
∅ For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, ESSA, monthly publication STORM DATA.

† Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5,000,000
7 $5,000,000 to $50,000,000
8 $50,000,000 to $500,000,000
9 $500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

NOVEMBER 1969

Elmer R. Nelson, Office of Hydrology

Extensive flooding resulted along 17 rivers in Puerto Rico on Nov. 9 from heavy rainfall ranging up to 6 to 8 inches over the southeastern portion. At least 20 towns or cities were damaged. The Weather Bureau issued flood warnings for the 17 rivers. Preliminary damage estimates were placed at $2 million. There were three deaths by drowning. The Civil Defense reported 13 houses destroyed and 123 houses and over 33 roads damaged. The heaviest damage occurred in the Fajardo area where over 500 families were affected.

Damages from flooding in continental United States during November were minor.

ST. LAWRENCE DRAINAGE

Lake Erie.--Minor flooding occurred on the St. Marys River at Decatur, Ind., and on the Maumee River at Fort Wayne, Ind., on the 19th-21st. The higher crest occurred on the St. Marys at Decatur and was nearly 2 ft. above flood stage. No flood damage was reported.

ATLANTIC SLOPE DRAINAGE

Moderate to heavy rain on the 7-8th caused the Susquehanna River to reach bankfull stage at Bainbridge, N. Y., on the 9th. No damage resulted from the rise.

The Satilla River near Atkinson, Ga., crested 0.7 foot above flood stage on the 8th. It was out of its banks from the 6th to the 11th. No damage resulted from the minor overflow.

MISSISSIPPI SYSTEM

Missouri Basin.--Heavy rains during the last 3 days of October caused the Grand River at Sumner, Mo., to rise nearly 2 ft. above flood stage. No reports of flood damage were received.

Ohio Basin.--Moderate rain on the 18-19th caused a minor overflow on the Scioto River at La Rue, Ohio, on the 20th. No flood damage was reported.

This same storm caused heavier and more widespread flooding in the Wabash Basin in Indiana. Eagle Creek at Zionsville, Ind., crested 2.5 ft. above flood stage on the 19th. The lower White River in the reach from Spencer to Edwardsport, Ind., crested about 2 ft. above flood stage. Crests on the Wabash River in the reach from Lafayette to Terre Haute, Ind., ranged from 3.7 ft. to 0.7 foot above flood stage. Although a small amount of corn remained in some fields, flood damage surveys did not indicate any damage.

White Basin.--Minor flooding developed on the Cache River in eastern Arkansas on the 24th. The overflow resulted from rainfall averaging 2 inches on the 16-17th. It crested at Patterson on the 27th, 1.5 ft. above flood stage. It receded within its banks on Dec. 4. No appreciable damage resulted from the overflow since only low-lying farmland and pastureland along the river were flooded.

Red Basin.--The Sulphur River at Hagansport in northeast Texas rose nearly 6 ft. above flood stage on Oct. 31. It receded within its banks on Nov. 1. No damage resulted from the flooding.

WEST GULF OF MEXICO DRAINAGE

Heavy rains on Oct. 27 caused moderate flooding on Turkey Creek at Crystal City, Tex., from Oct. 28 to Nov. 2. A moderate rise moved down the Nueces River below Turkey Creek, causing bankfull stages and minor flooding until the middle of November. Lake Corpus Christi continued at capacity level of 94 ft. or up to about a tenth of a foot higher through Nov. 14. It rose to slightly above 94 ft. again on the 27th and continued through the end of the month. Bankfull stages with minor flooding continued below the dam to Nueces Bay through Nov. 15.

Heavy rains of 2 to 4 inches in the Corpus Christi area on the night of Nov. 26 caused considerable flooding of streets and roads through the night.

PACIFIC SLOPE DRAINAGE

Minor flooding occurred on the Nooksack River at Deming, Wash., on the 4th. This brief overflow resulted from heavy rainfall totalling about 3 inches in association with a Pacific front moving through western Washington. No damage resulted from the rapid rise.

Note: All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

\+ Observations for these stations are scheduled at 0000 G.C.T.

† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the surface and higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun.

( ) Doubtful
HS Slight haze
HM Moderate haze
* Values corresponding to true solar noon

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys. NOVEMBER 1969

Note.--Langley is the unit used to denote one gram calorie per square centimeter. Values with an asterisk are interpolated.

U Indicates Urban sites.

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

NOVEMBER 1969

Note.--Langley is the unit used to denote one gram calorie per square centimeter. Values with an asterisk are interpolated.

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 p.m.) at Palmer, Alaska

NOVEMBER 1969

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	-40	-36	-15	-4	-61	-100	-42	-58	-34	-147	-77	-46	-92	-104	-145	-83	-62	-61	-33	-30	-59	-33	-15	-47	-35	-58	-82	-55	-86	-13		-58

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer, Exp. Station. The instrument with which they were measured has not been checked by the ESSA, Weather Bureau.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (<3900 Å) at Ames, Iowa

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	2.36	2.56	2.17	6.81	7.69	7.20	7.30	4.73	5.42	3.84	6.21	4.83	4.44	6.41	7.79	3.94	1.18	6.02	6.90	4.83	6.71	4.44	6.11	6.41	6.51	6.02	3.35	6.21	6.41	6.11		5.36

These data are from an U - V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the ESSA, Weather Bureau.

TOTAL OZONE DATA

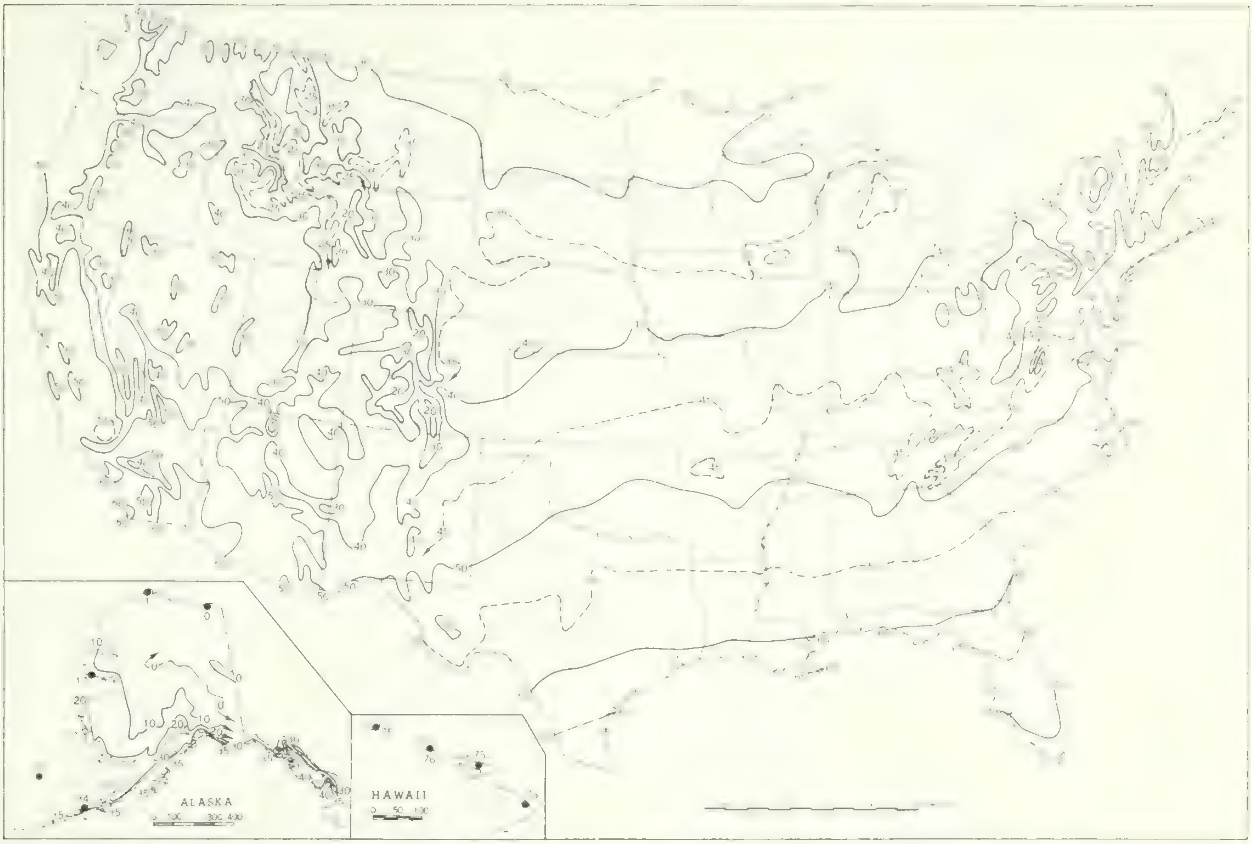
These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λ s Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

Station	Day of month																															
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O_3
															Data will be delayed																	

The spectrophotometer measures the total amount of ozone in the atmosphere, i. e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e. g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λ s designates the type of measurement made.

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), November



B. Temperature Departure from 30 - Year Mean (°F 1931-60), November 1969.

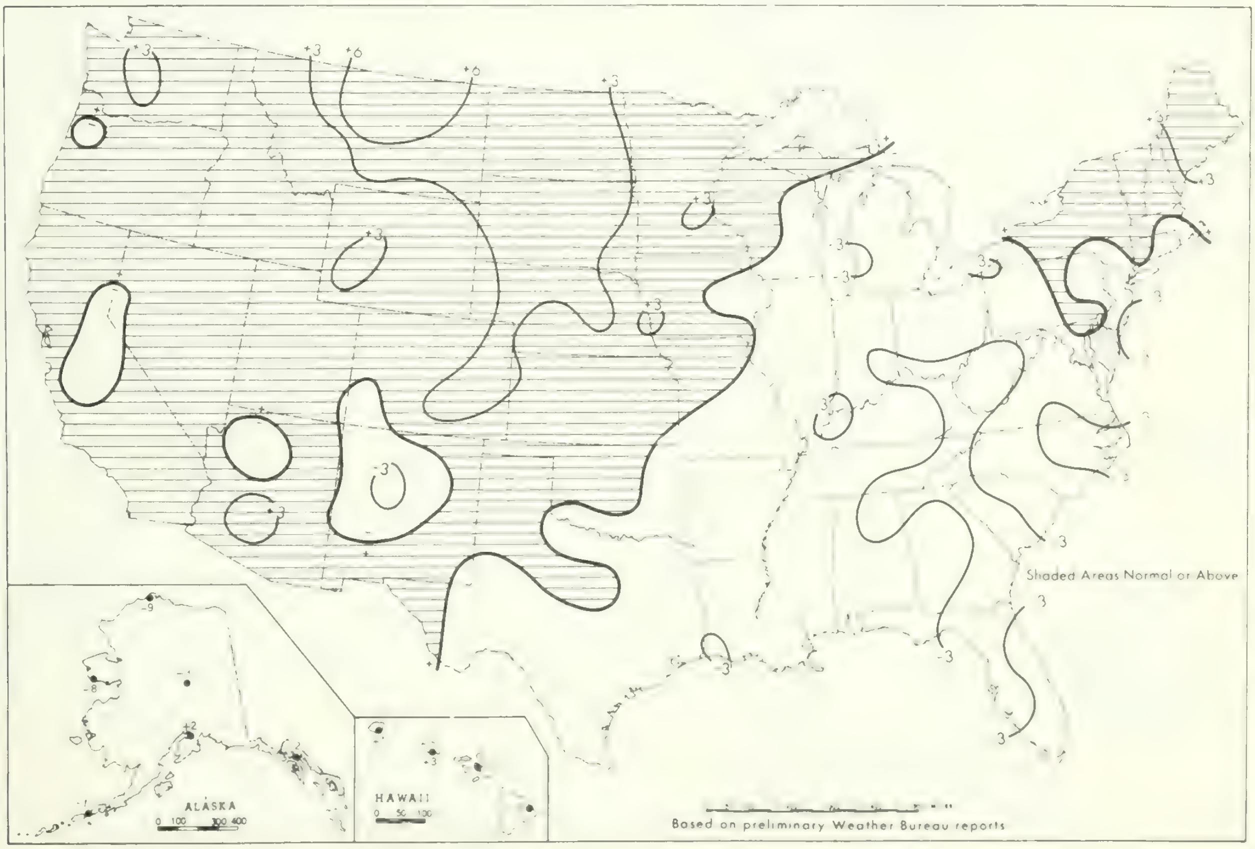


Chart II. Total Precipitation (Inches), November 1969.

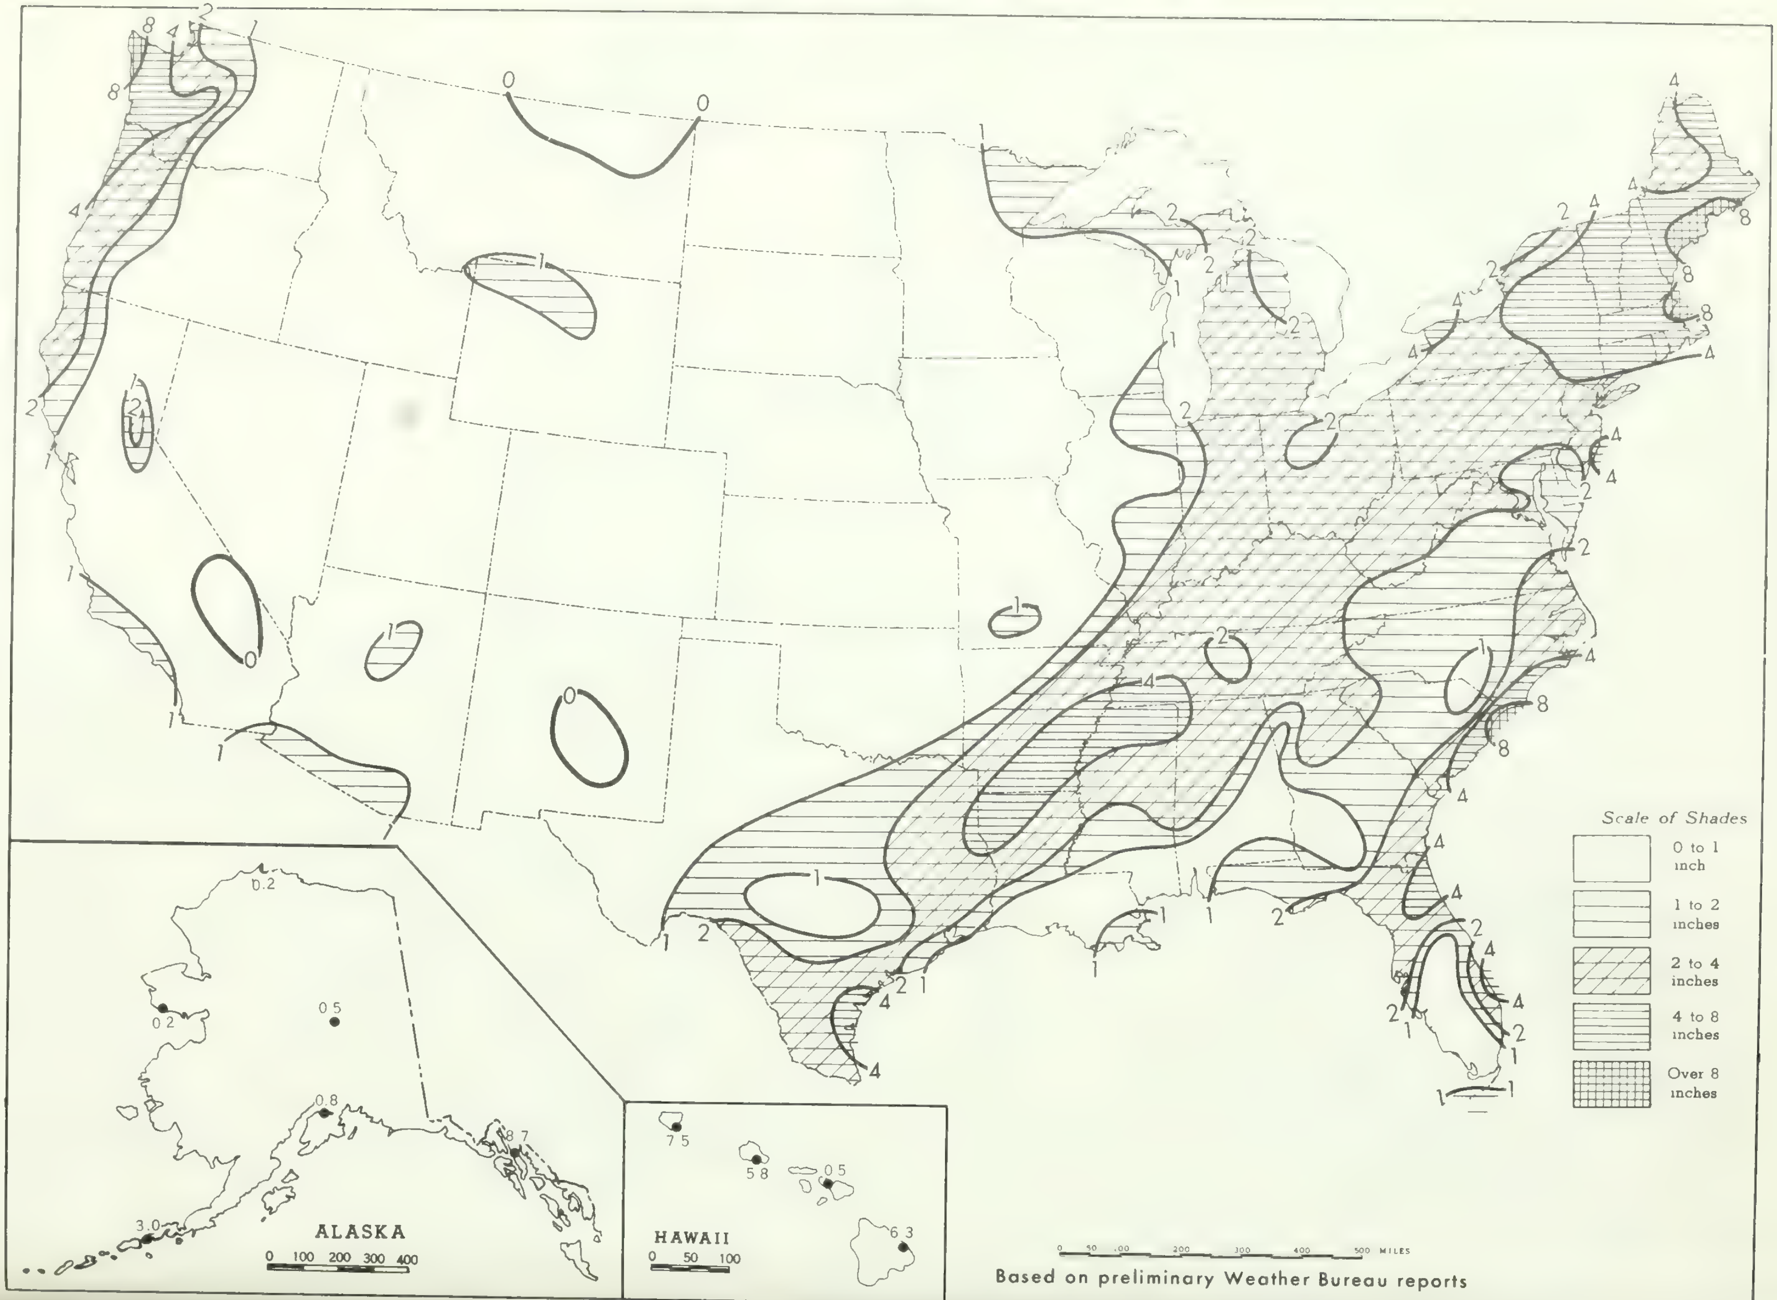

Chart III. Percentage of Normal Precipitation, November 1969.

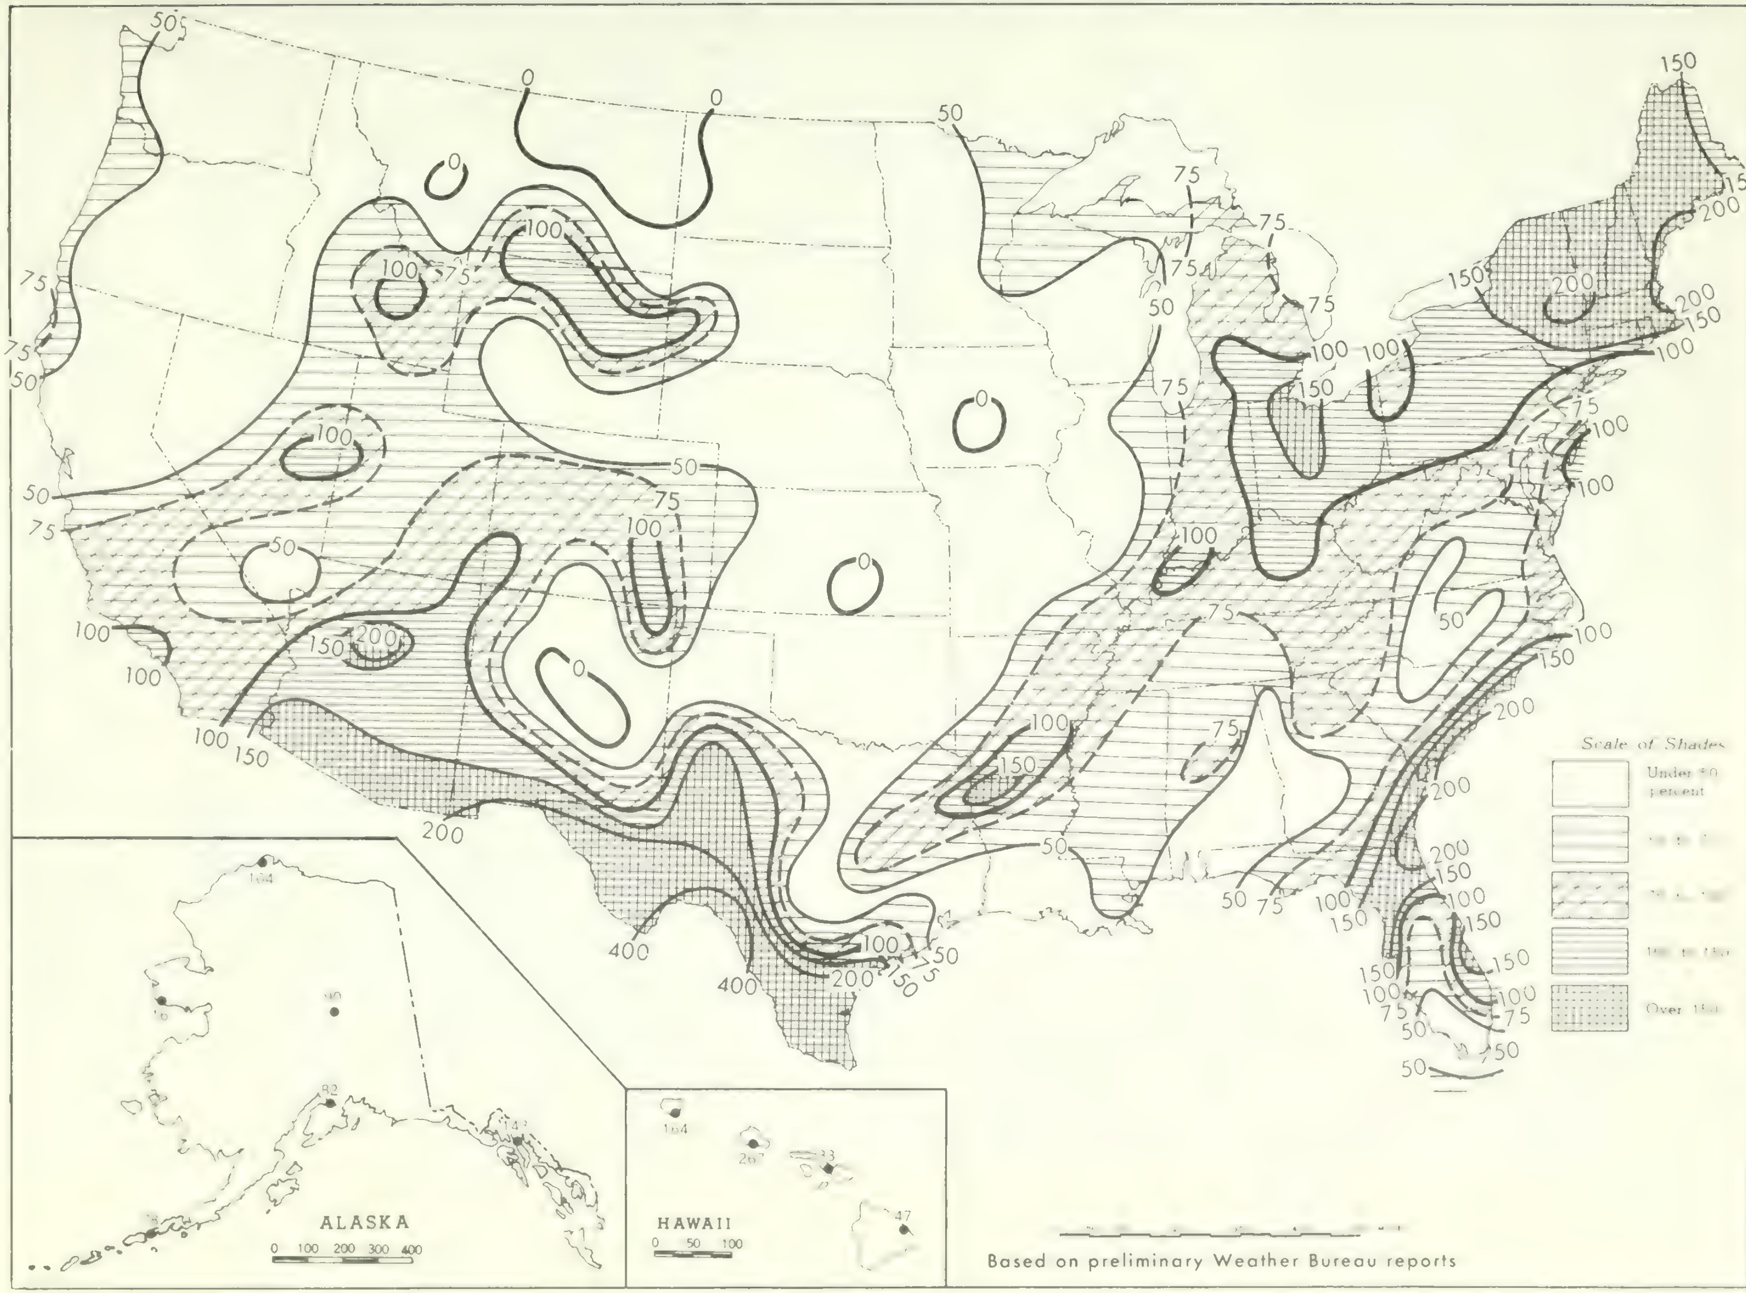

Chart IV. Total Snowfall (Inches), November 1969.

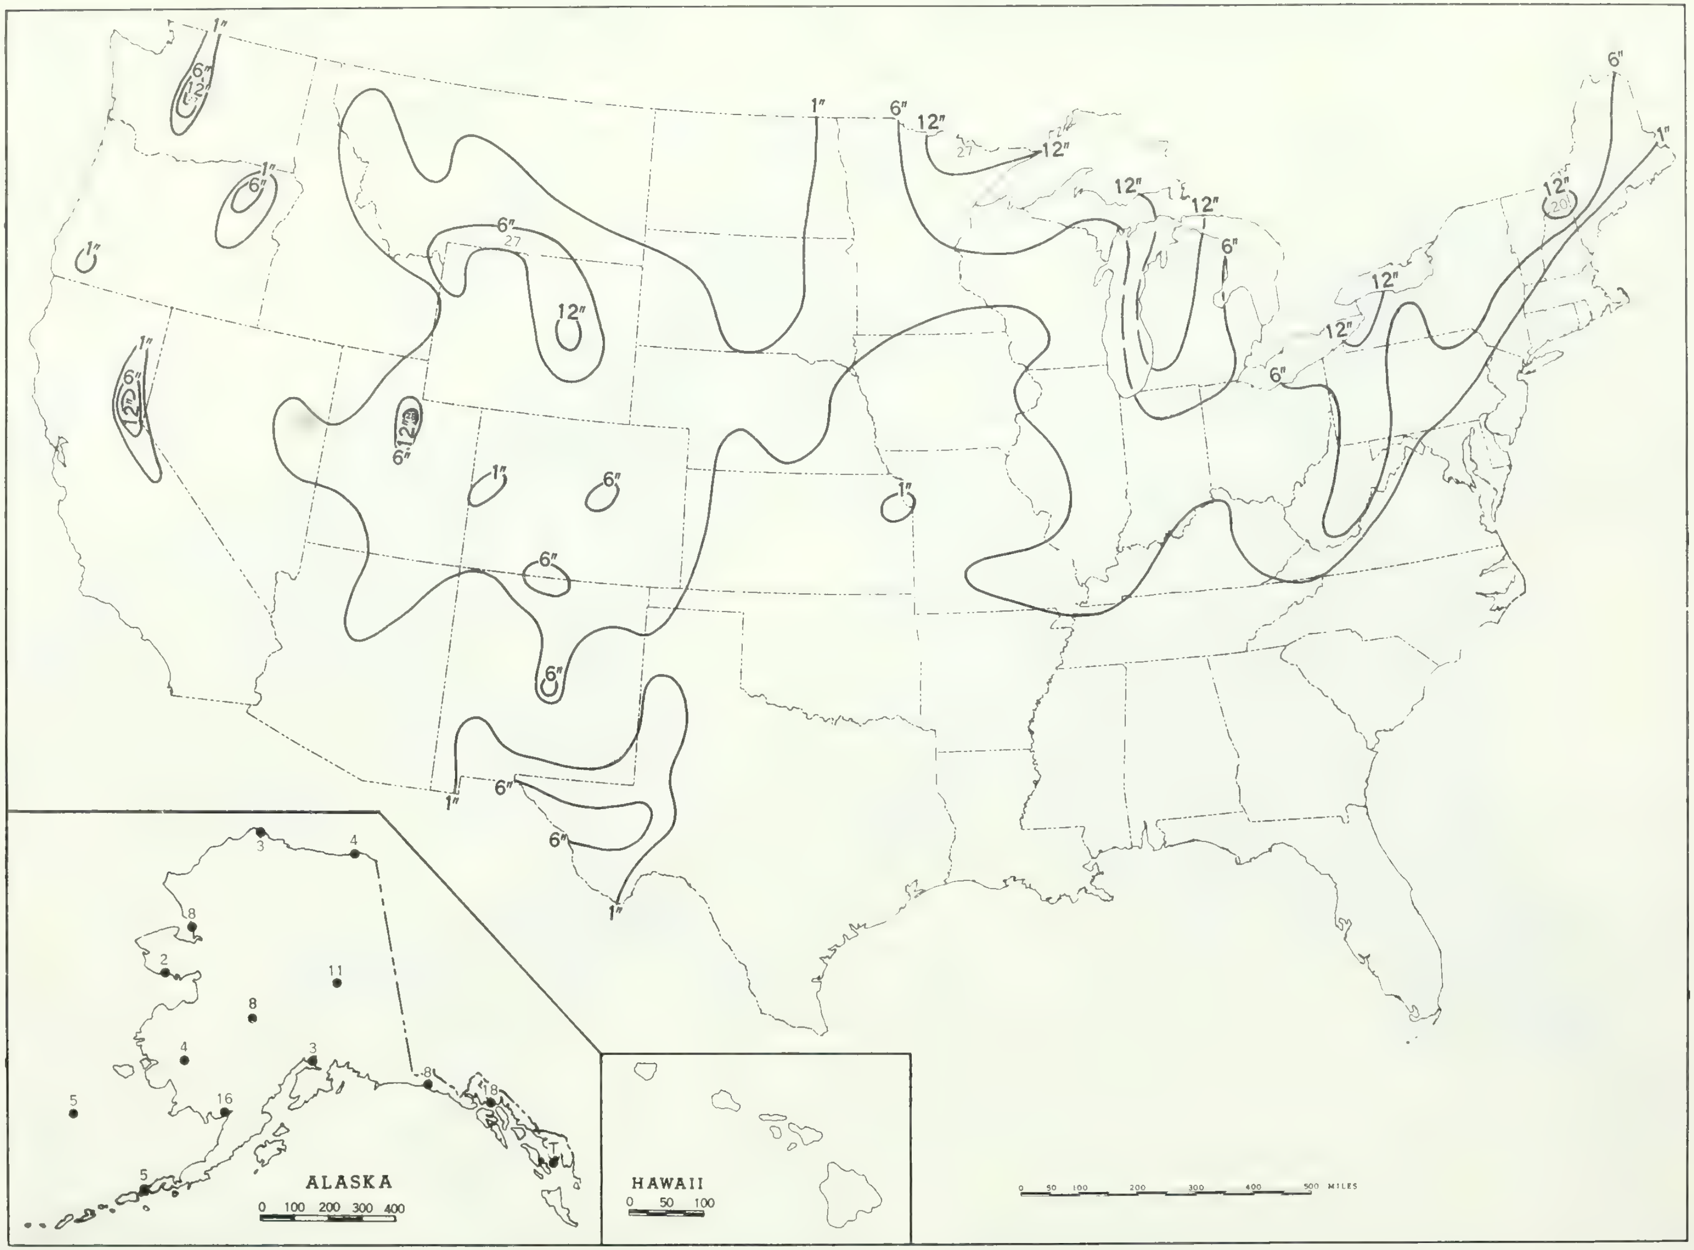
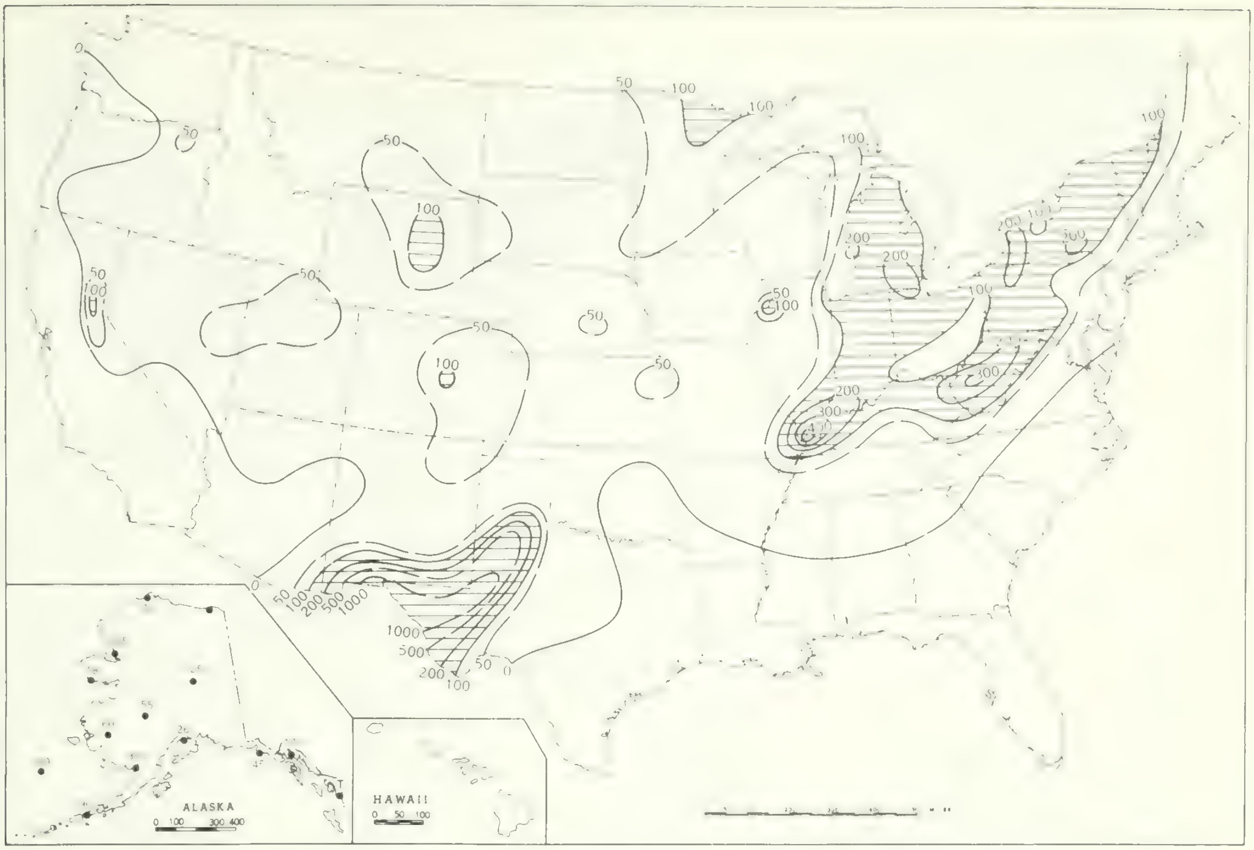
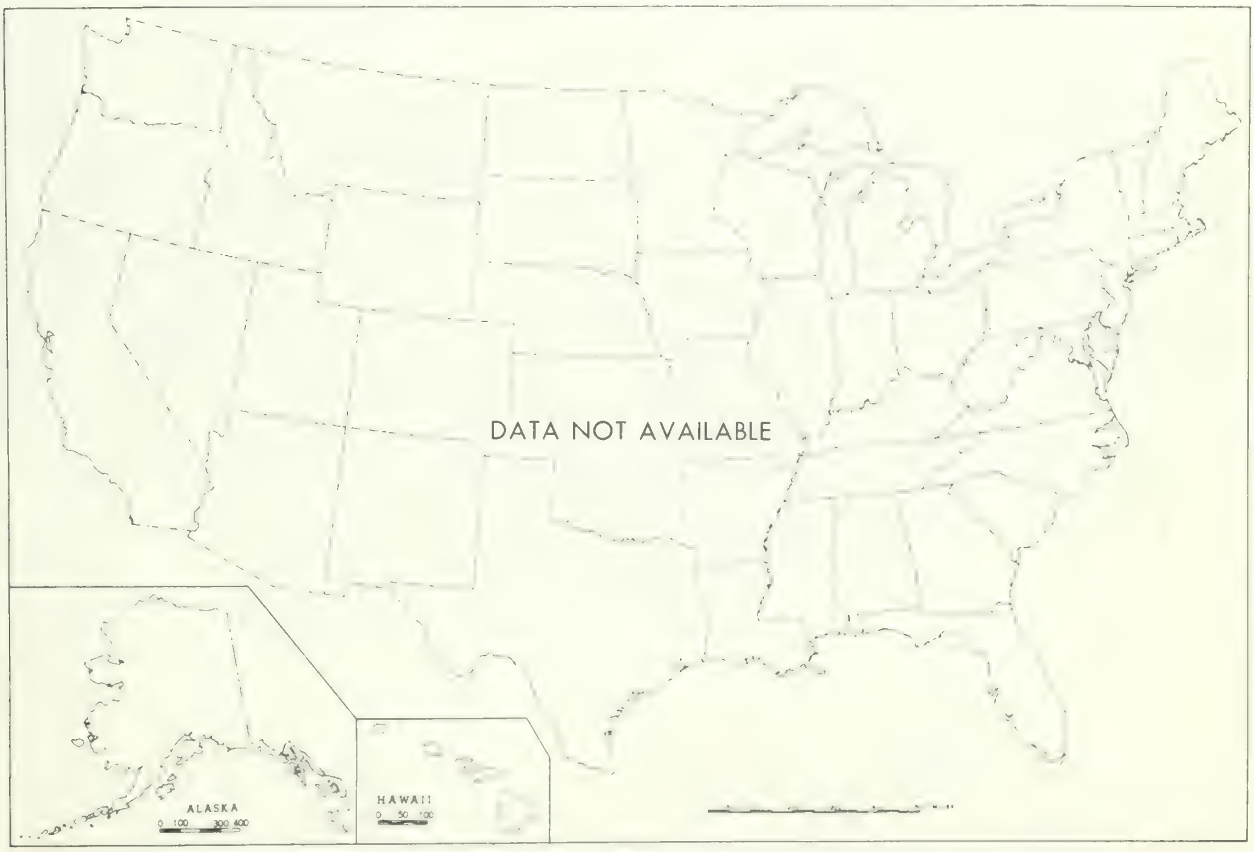


This is the total of unmelted snowfall recorded during the month at Weather Bureau and selected cooperative stations. This Chart and Chart V are published only for the months of November through April, although of course there is some snow at higher elevations, particularly in the far West, earlier and later in the year.

Chart V. A. Percentage of Mean Monthly Snowfall, November 1969.

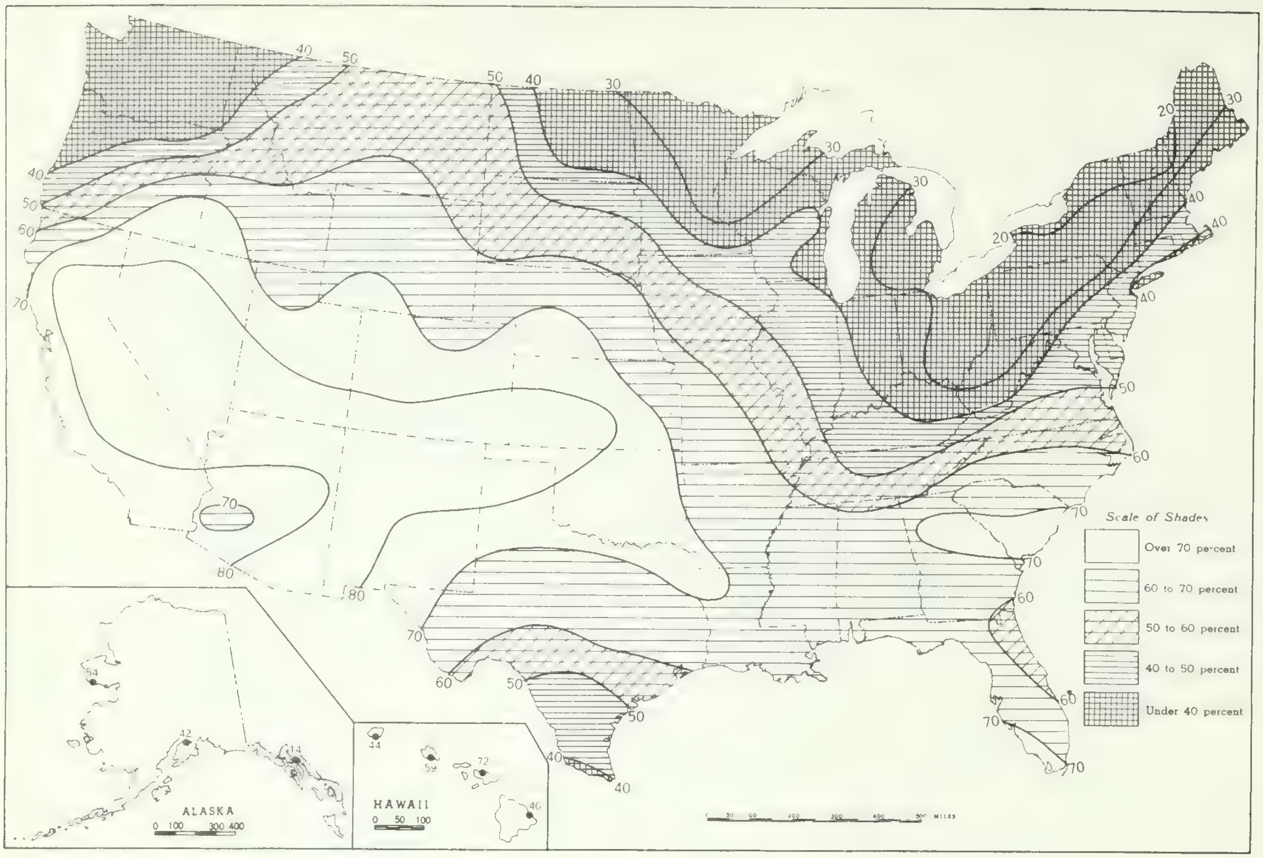


B. Depth of Snow on Ground (Inches), 7:00 a.m. E. S. T., November 1969.

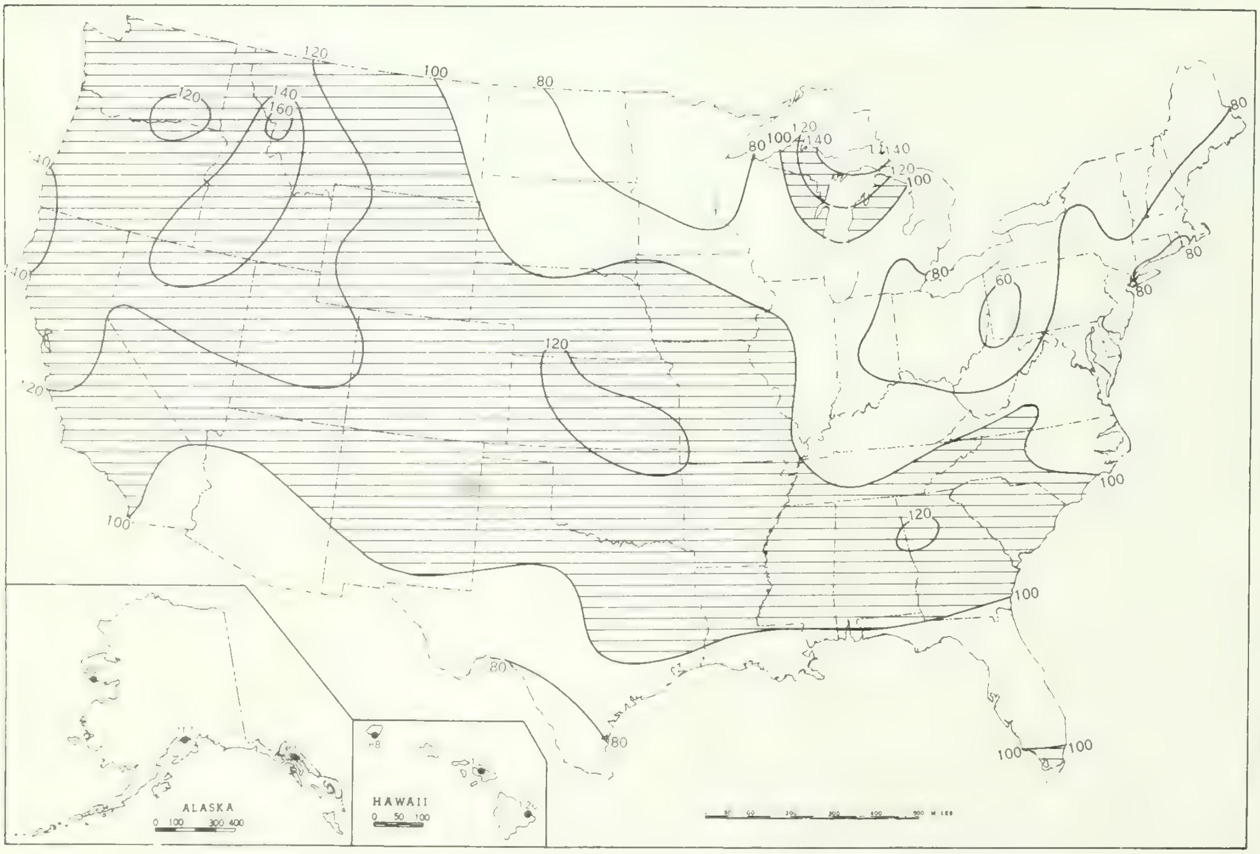


A. Amount of mean monthly snowfall is computed for Weather Bureau stations having at least 10 years of record.
B. Shows depth currently on ground at 7:00 a.m. E.S.T., of the Monday nearest the end of the month.
It is based on reports from Weather Bureau and selected cooperative stations.

Chart VI. A. Percentage of Possible Sunshine, November 1969.

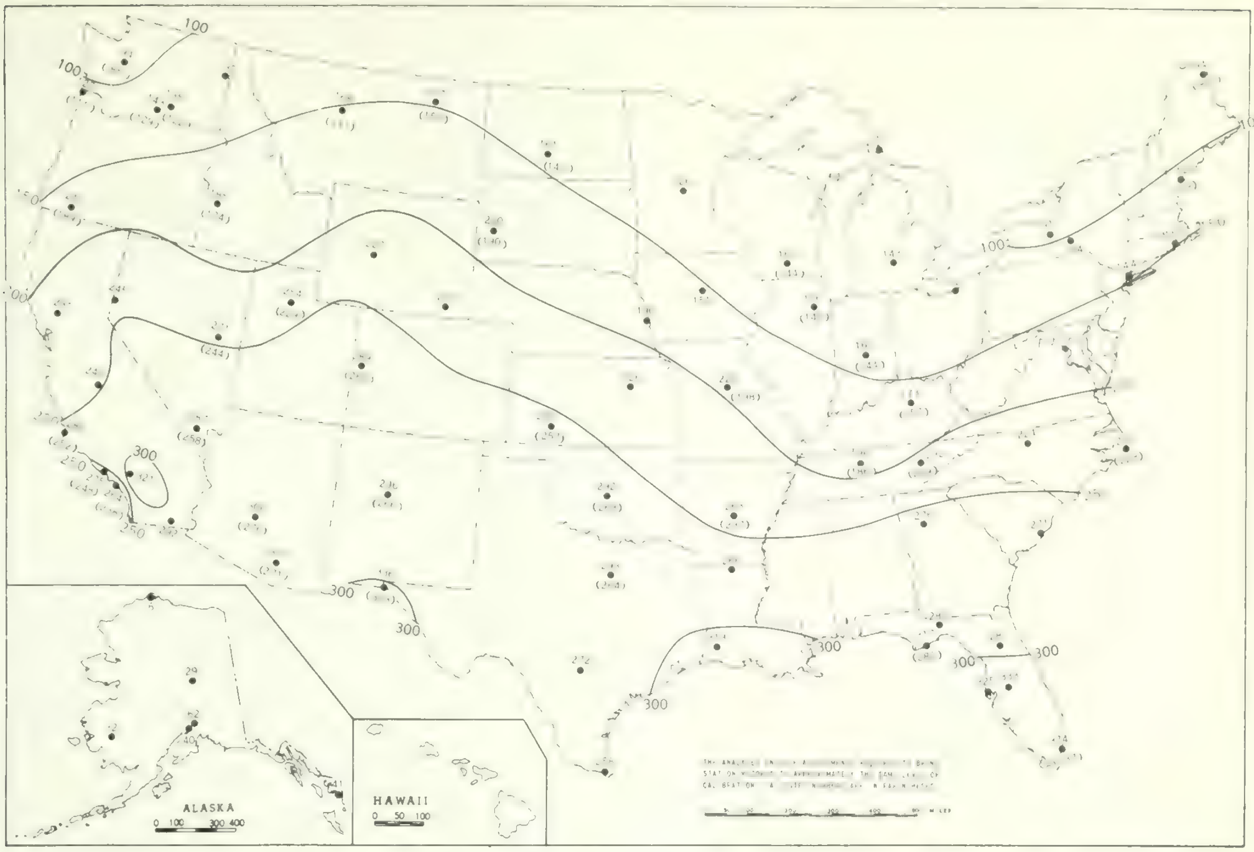


B. Percentage of Mean Monthly Sunshine, November 1969.

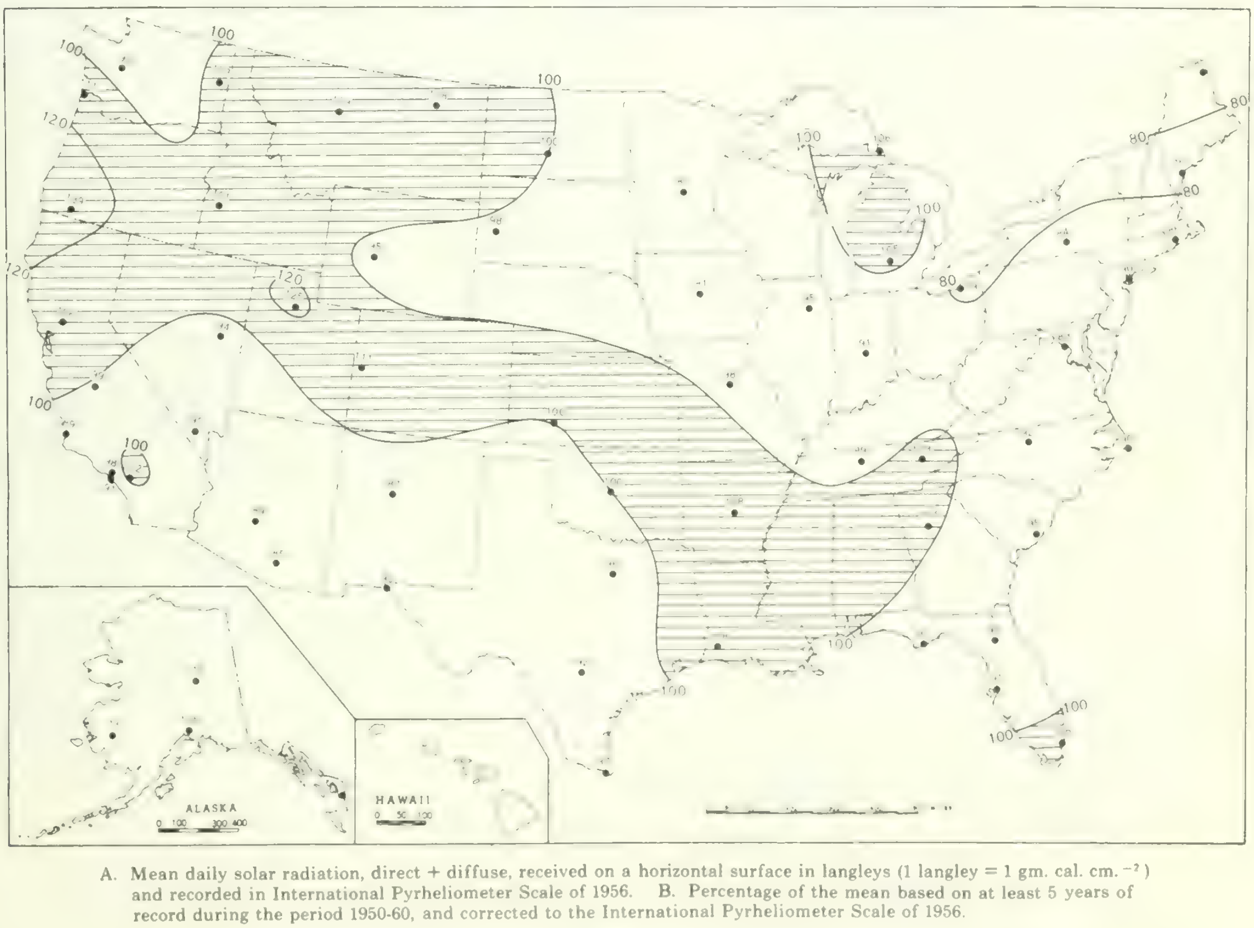


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, November 1969.

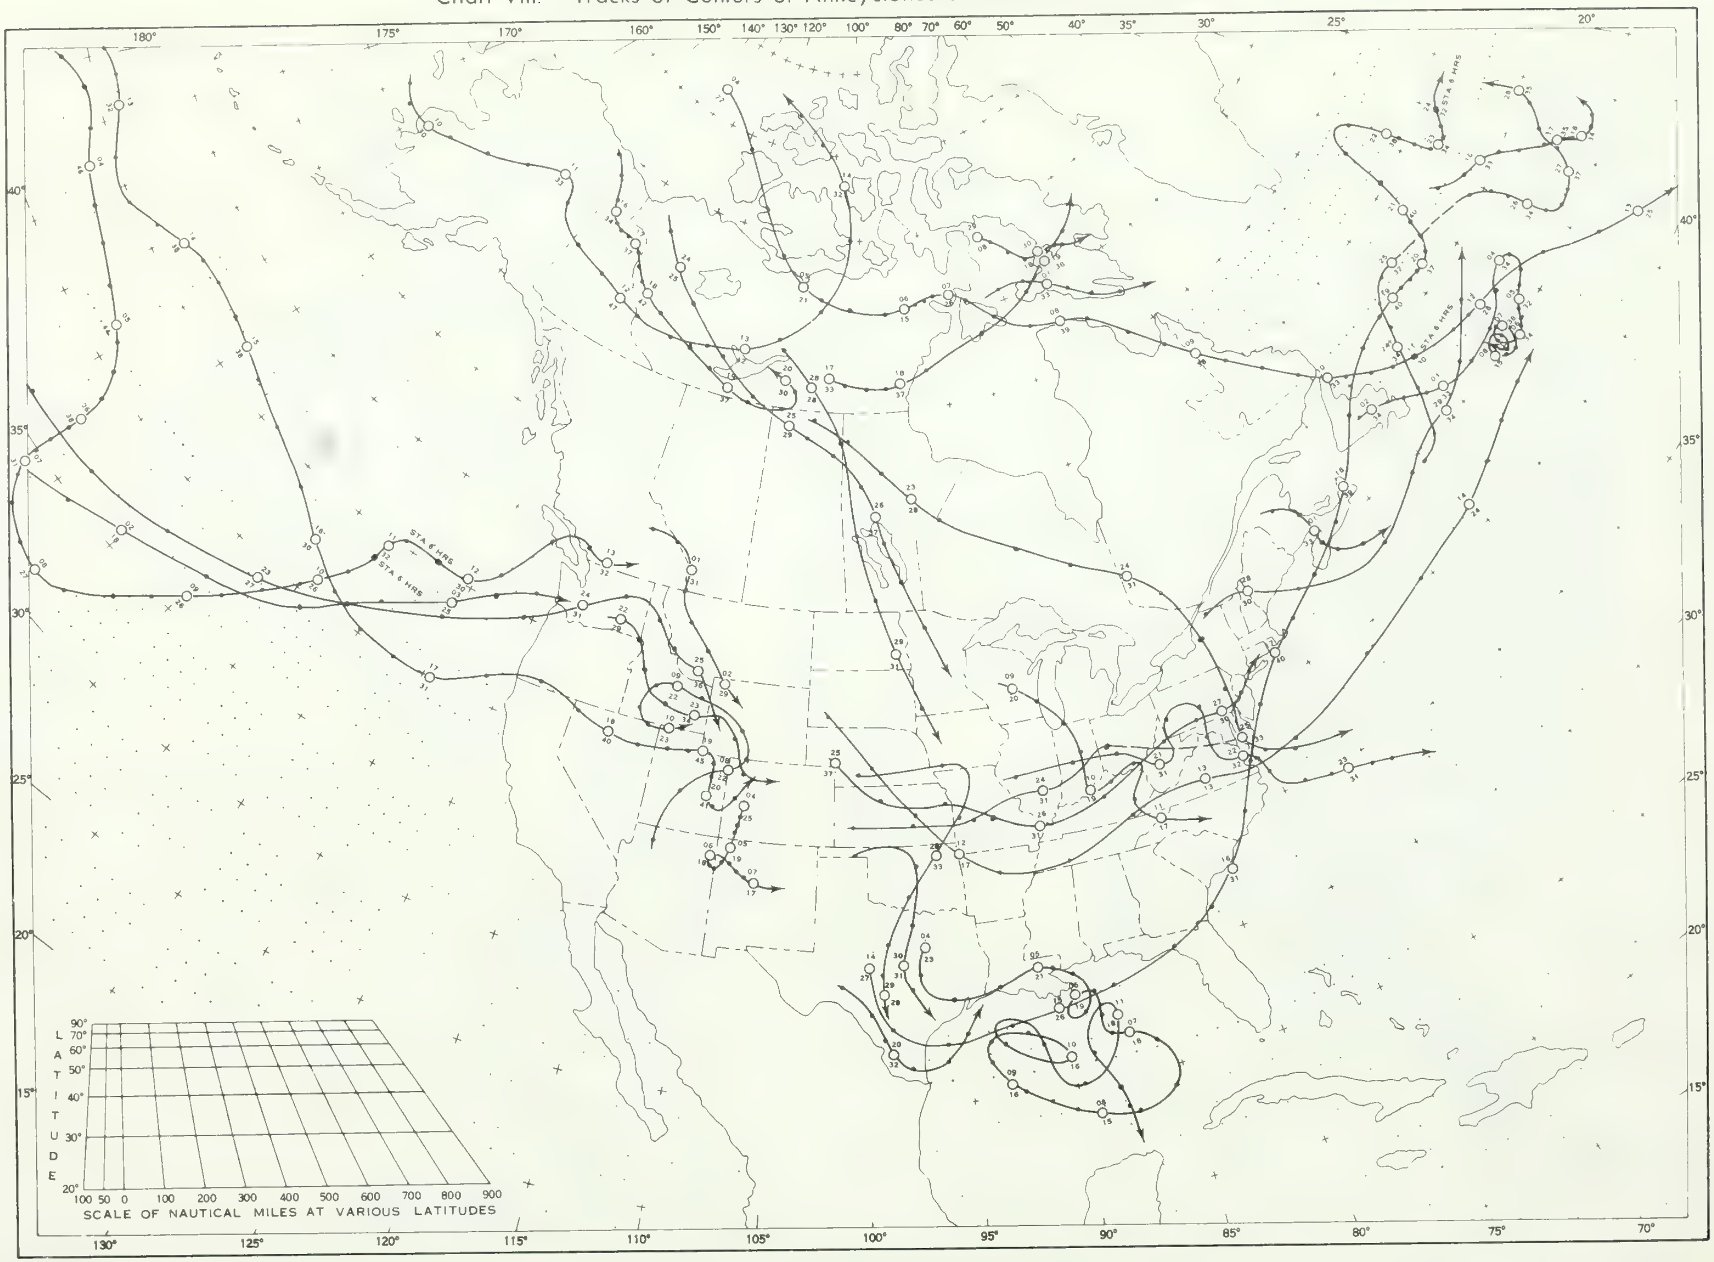


B. Percentage of Mean Daily Solar Radiation, November 1969.



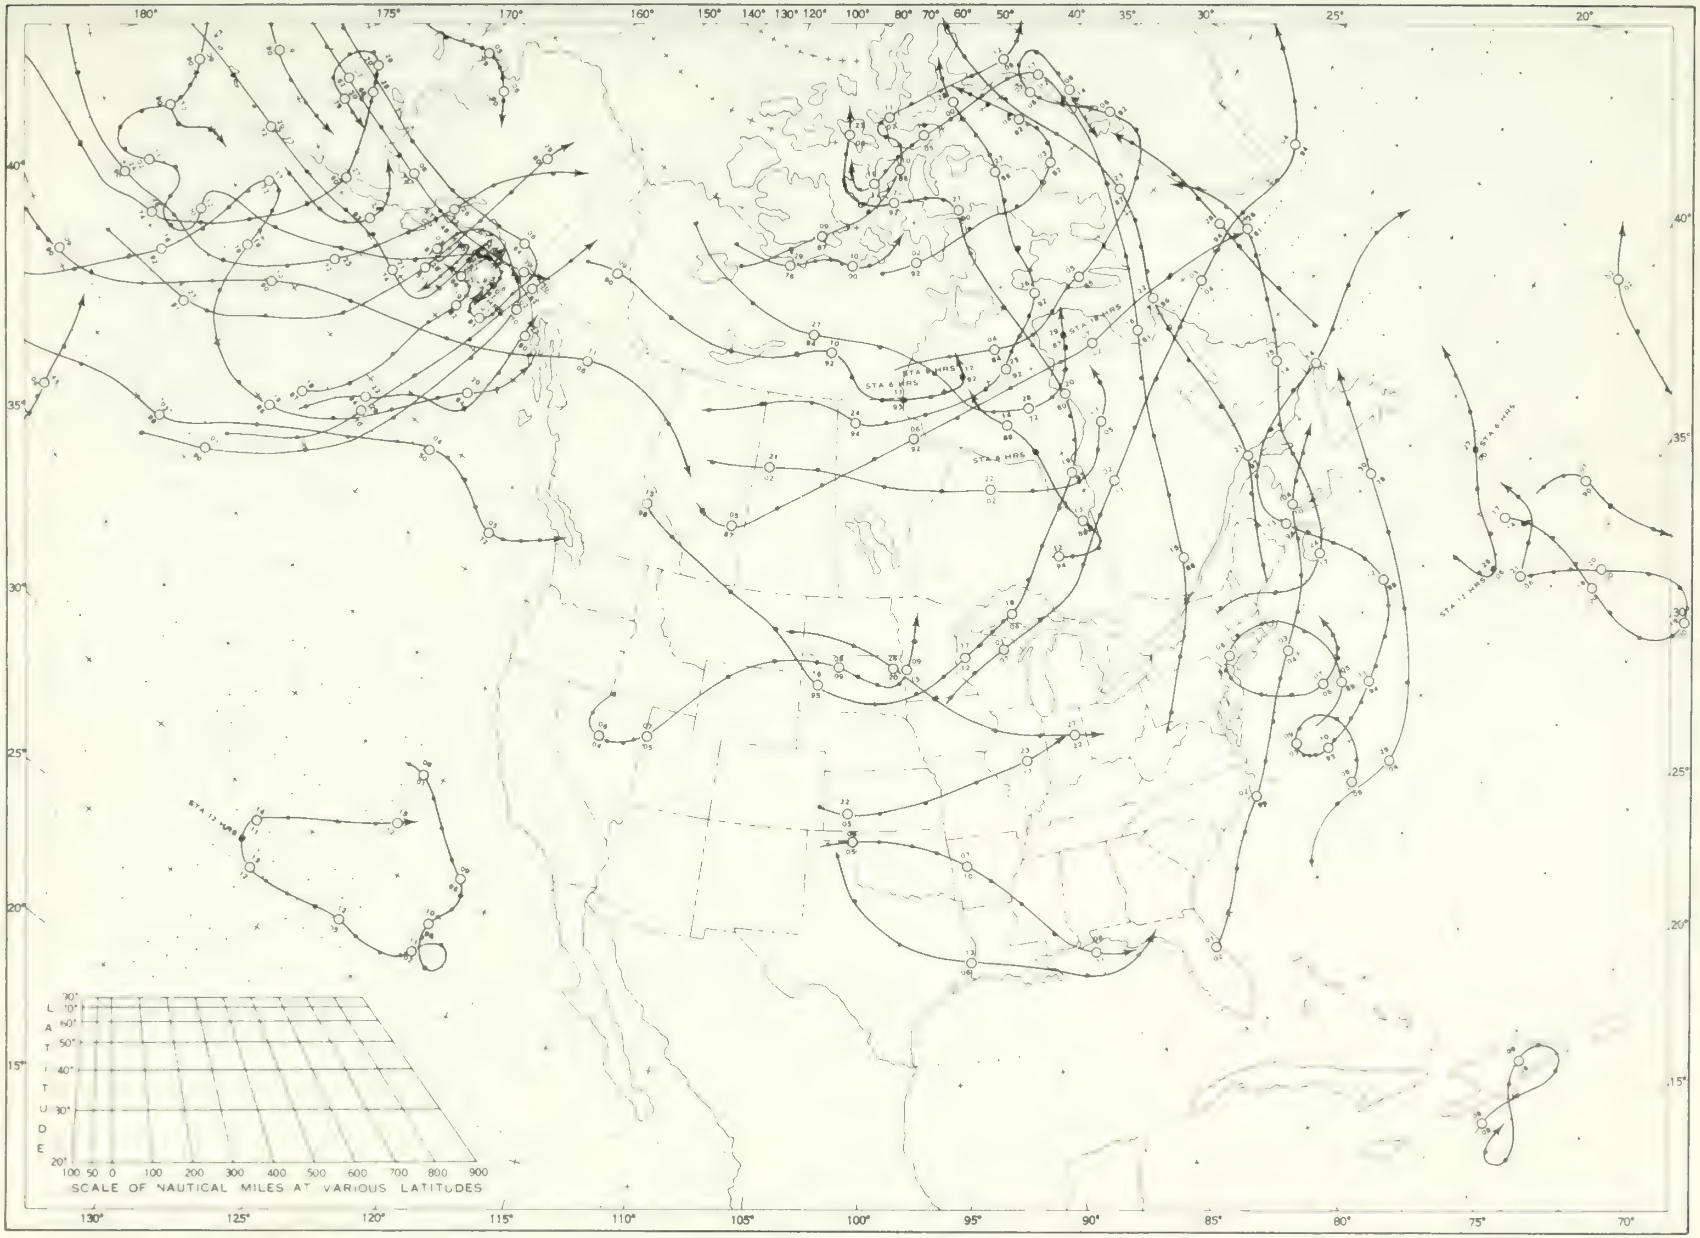
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, November 1969.



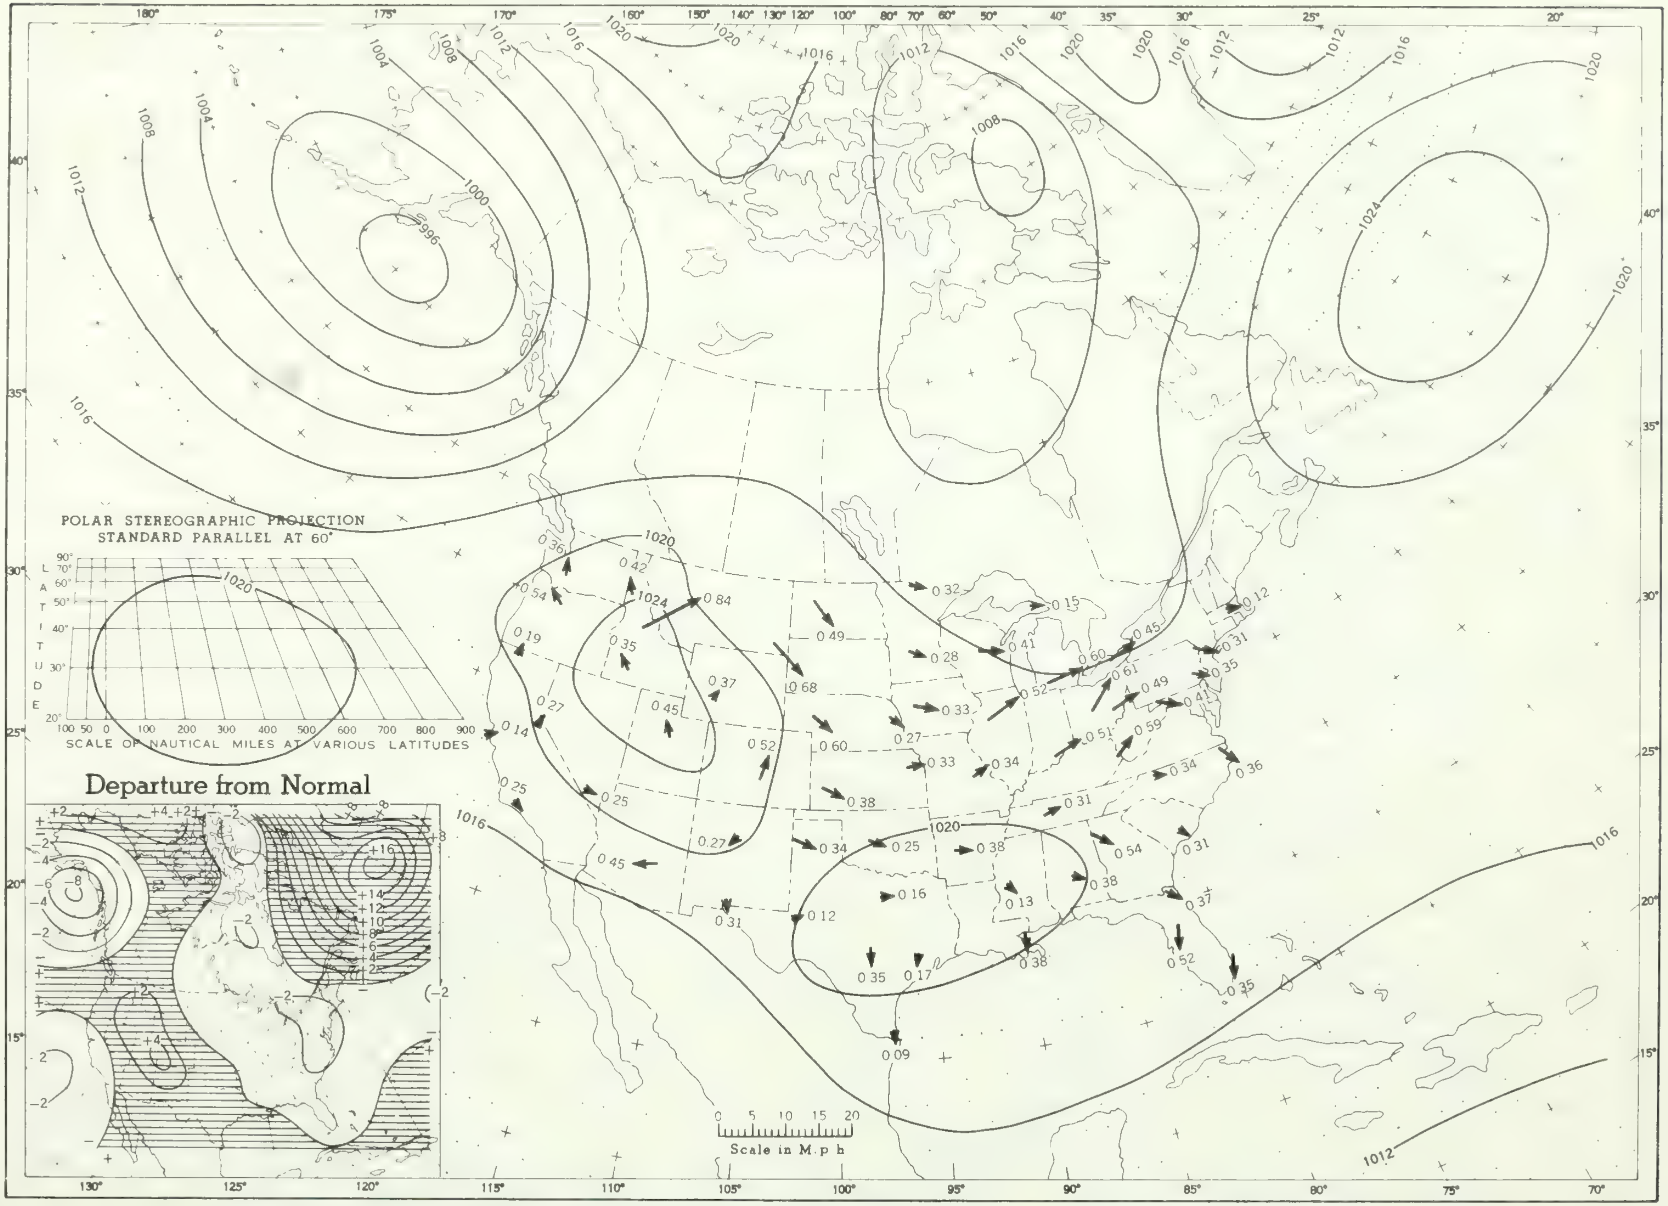
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, November 1969.



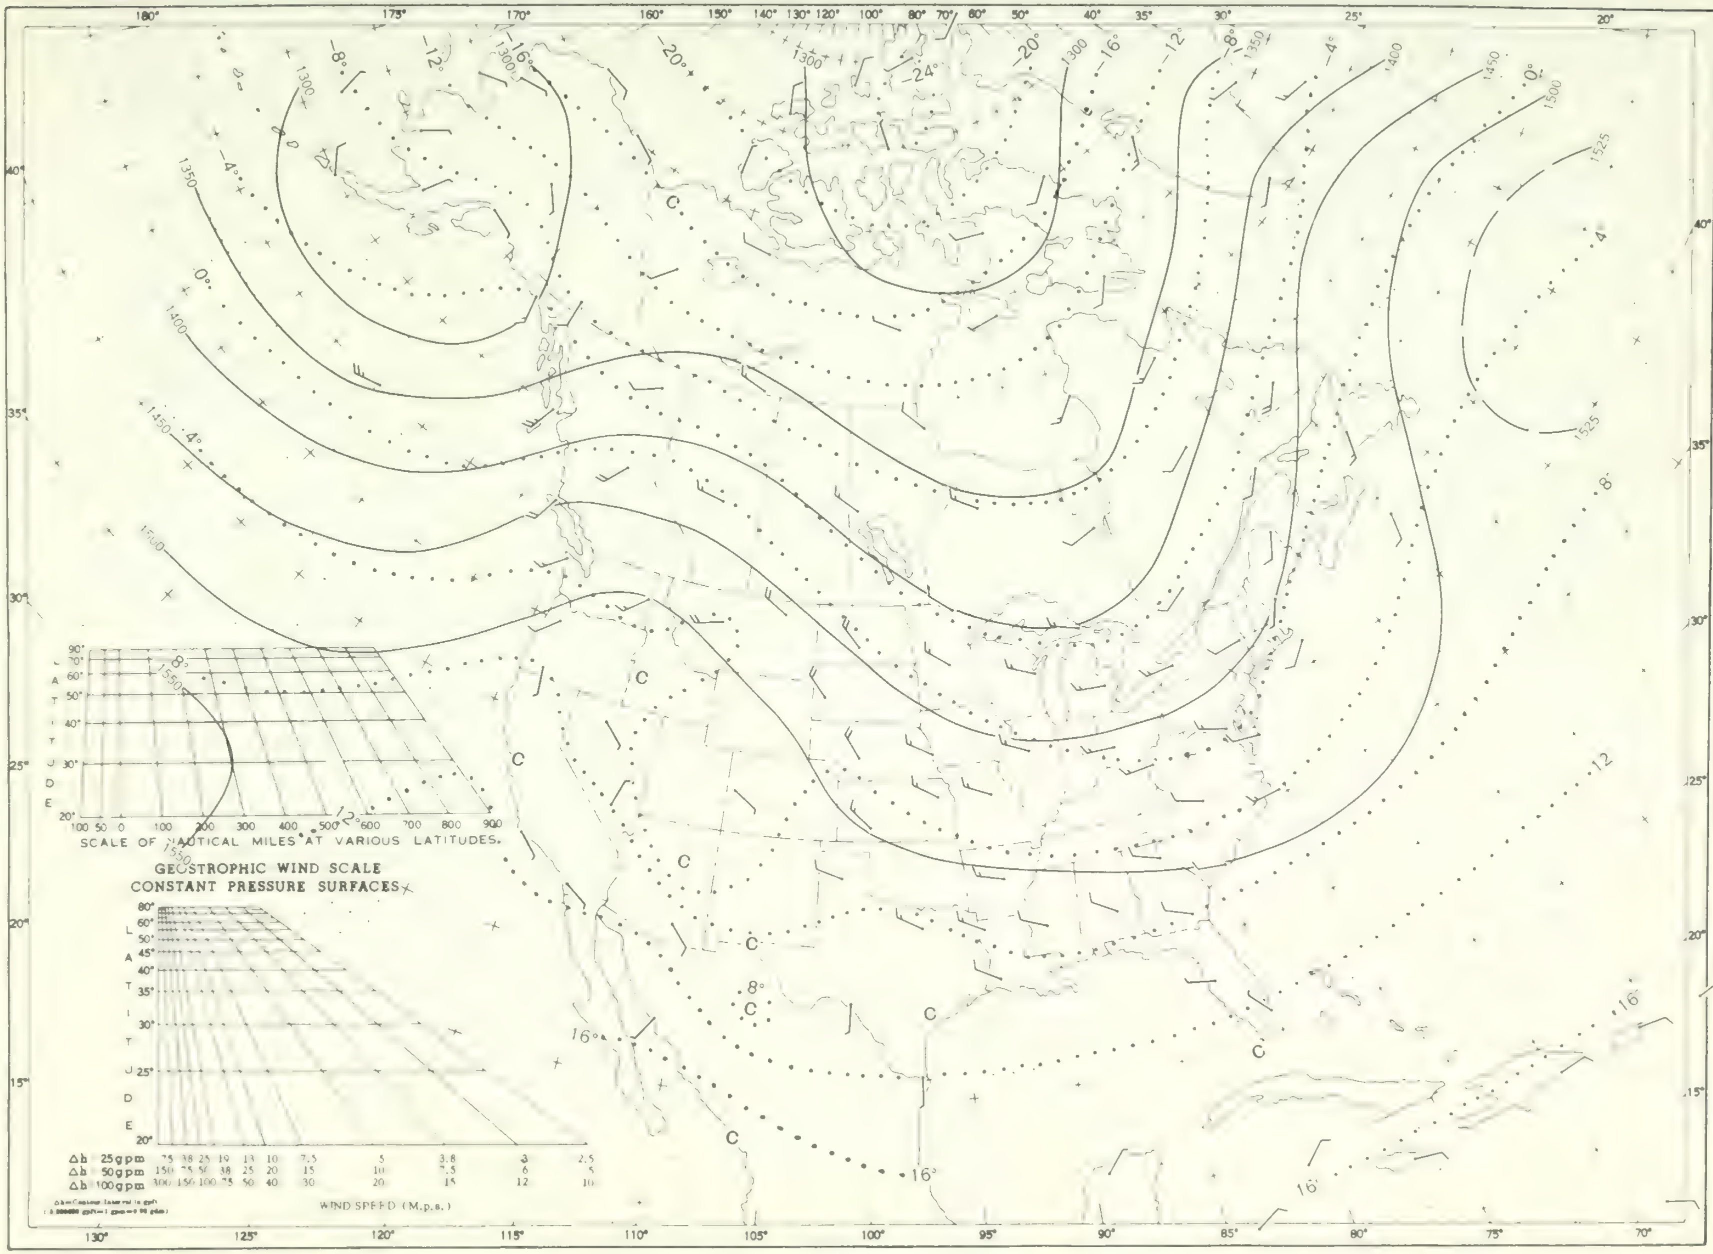
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, **November 1969**. Inset: Departure of Average Pressure (mb) from Normal, **November 1969**.



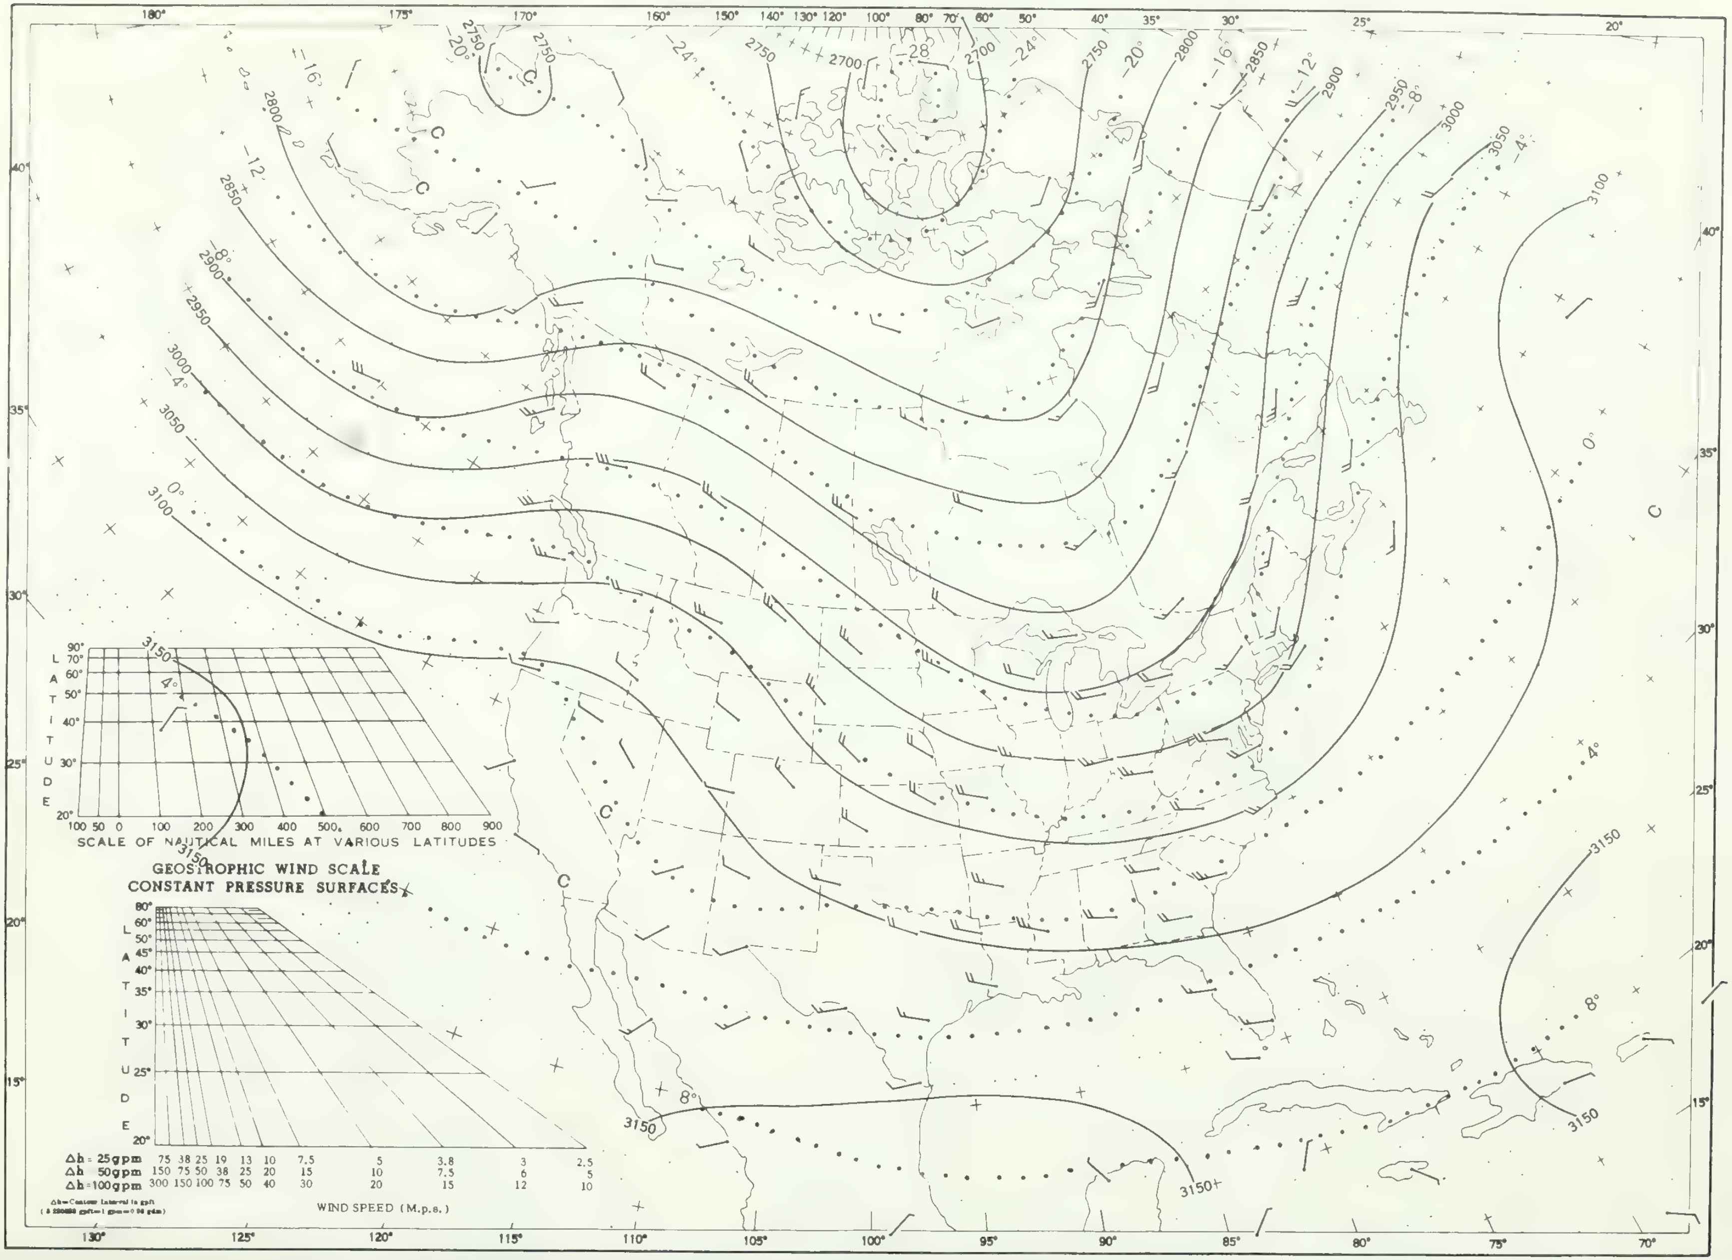
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb Surface, 1200 GMT, **November 1969**. Average Height and Temperature, and Resultant Winds



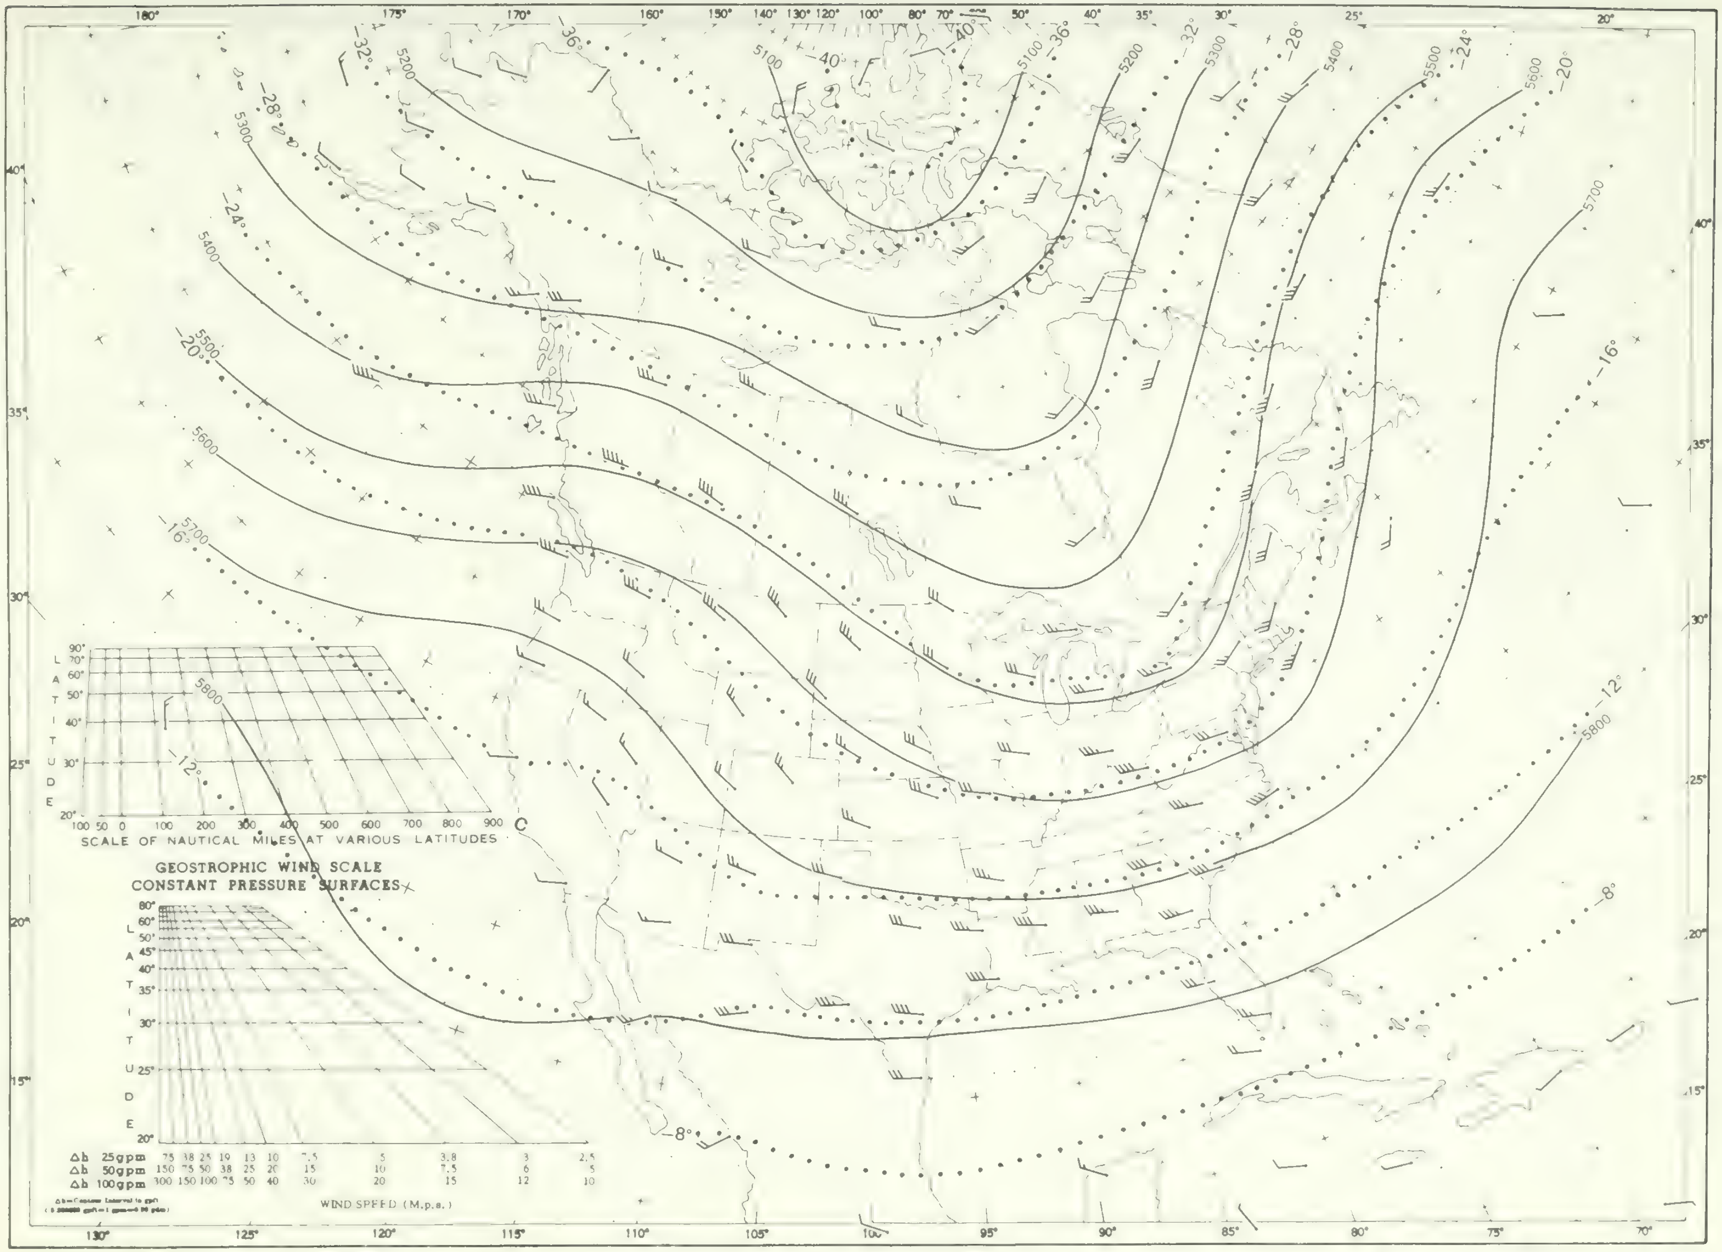
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb Surface, 1200 GMT, November 1969. Average Height and Temperature, and Resultant Winds



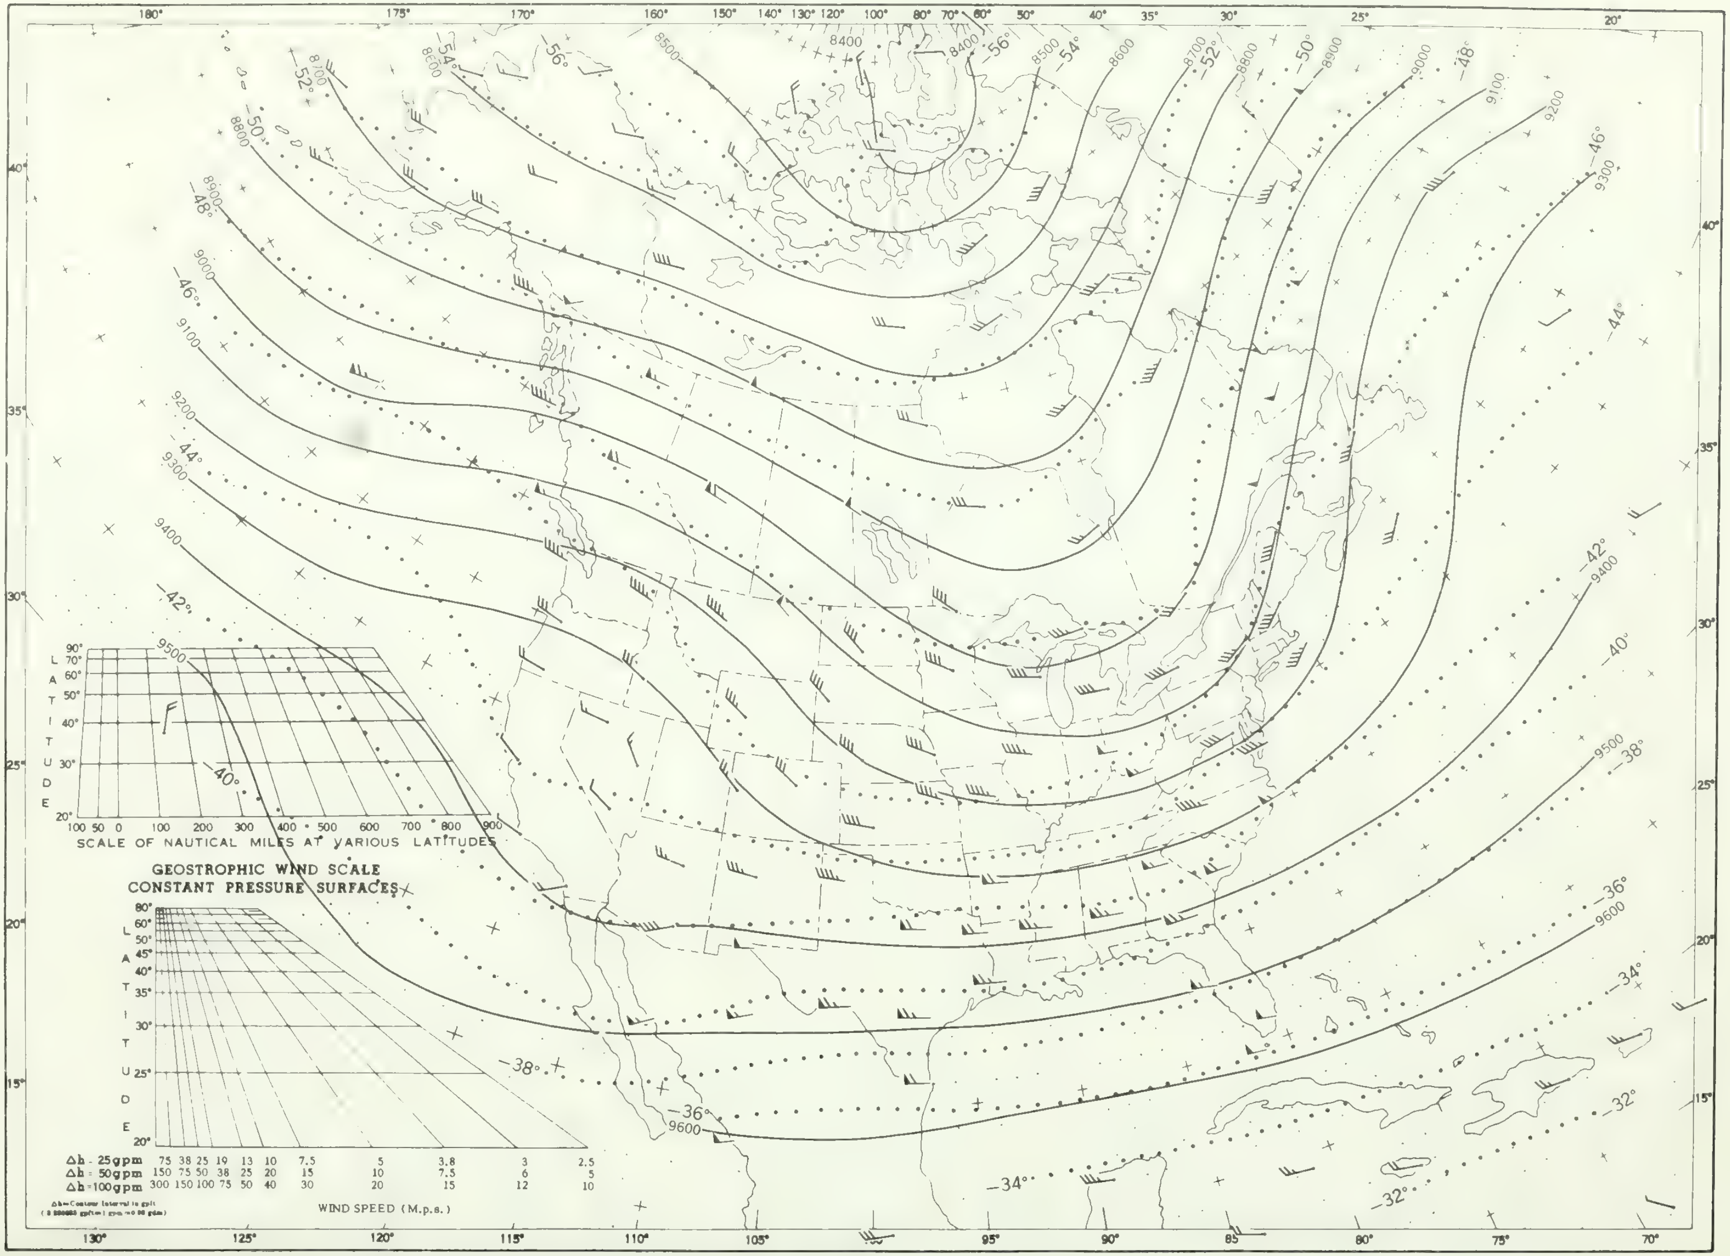
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII. 500-mb. Surface, 1200 GMT, November 1969. Average Height and Temperature, and Resultant Winds.



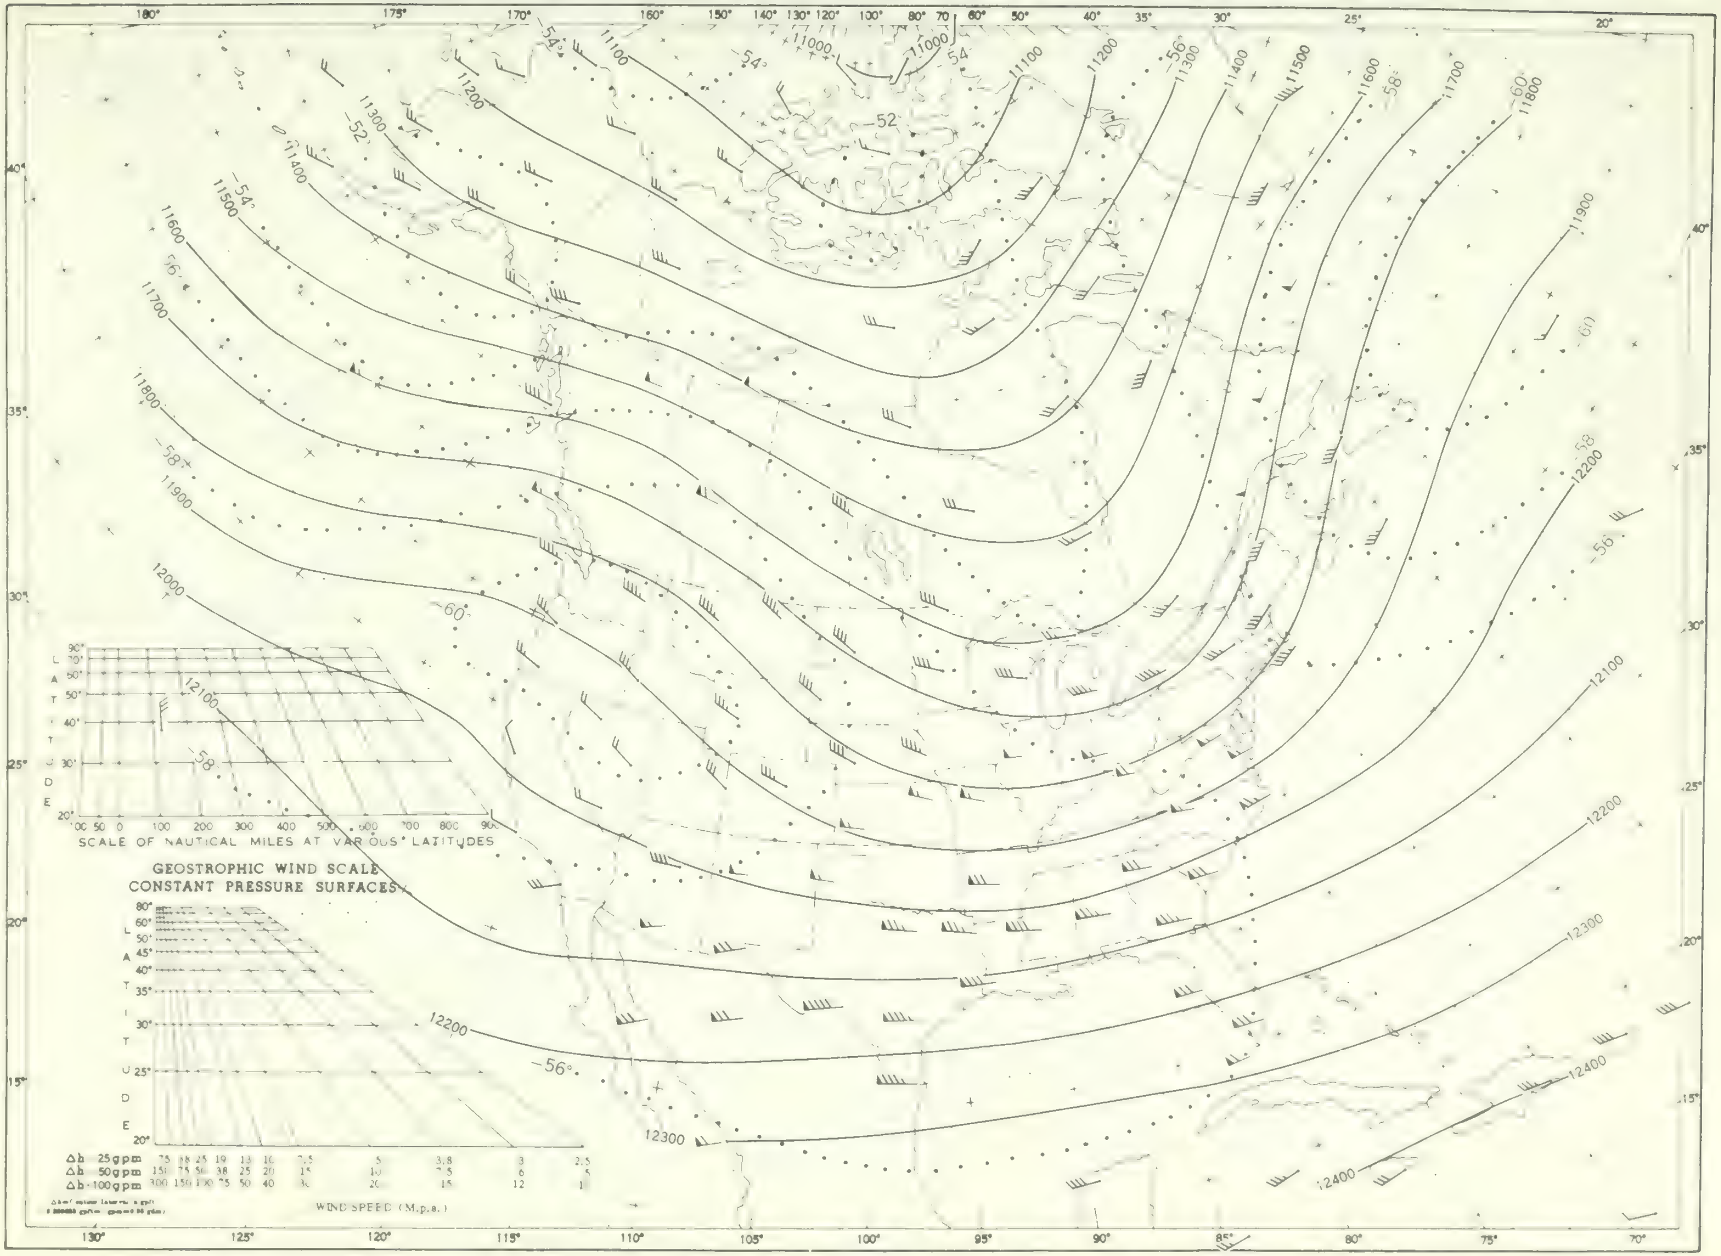
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV. 300-mb. Surface, 1200 GMT, November 1969. Average Height and Temperature, and Resultant Winds.



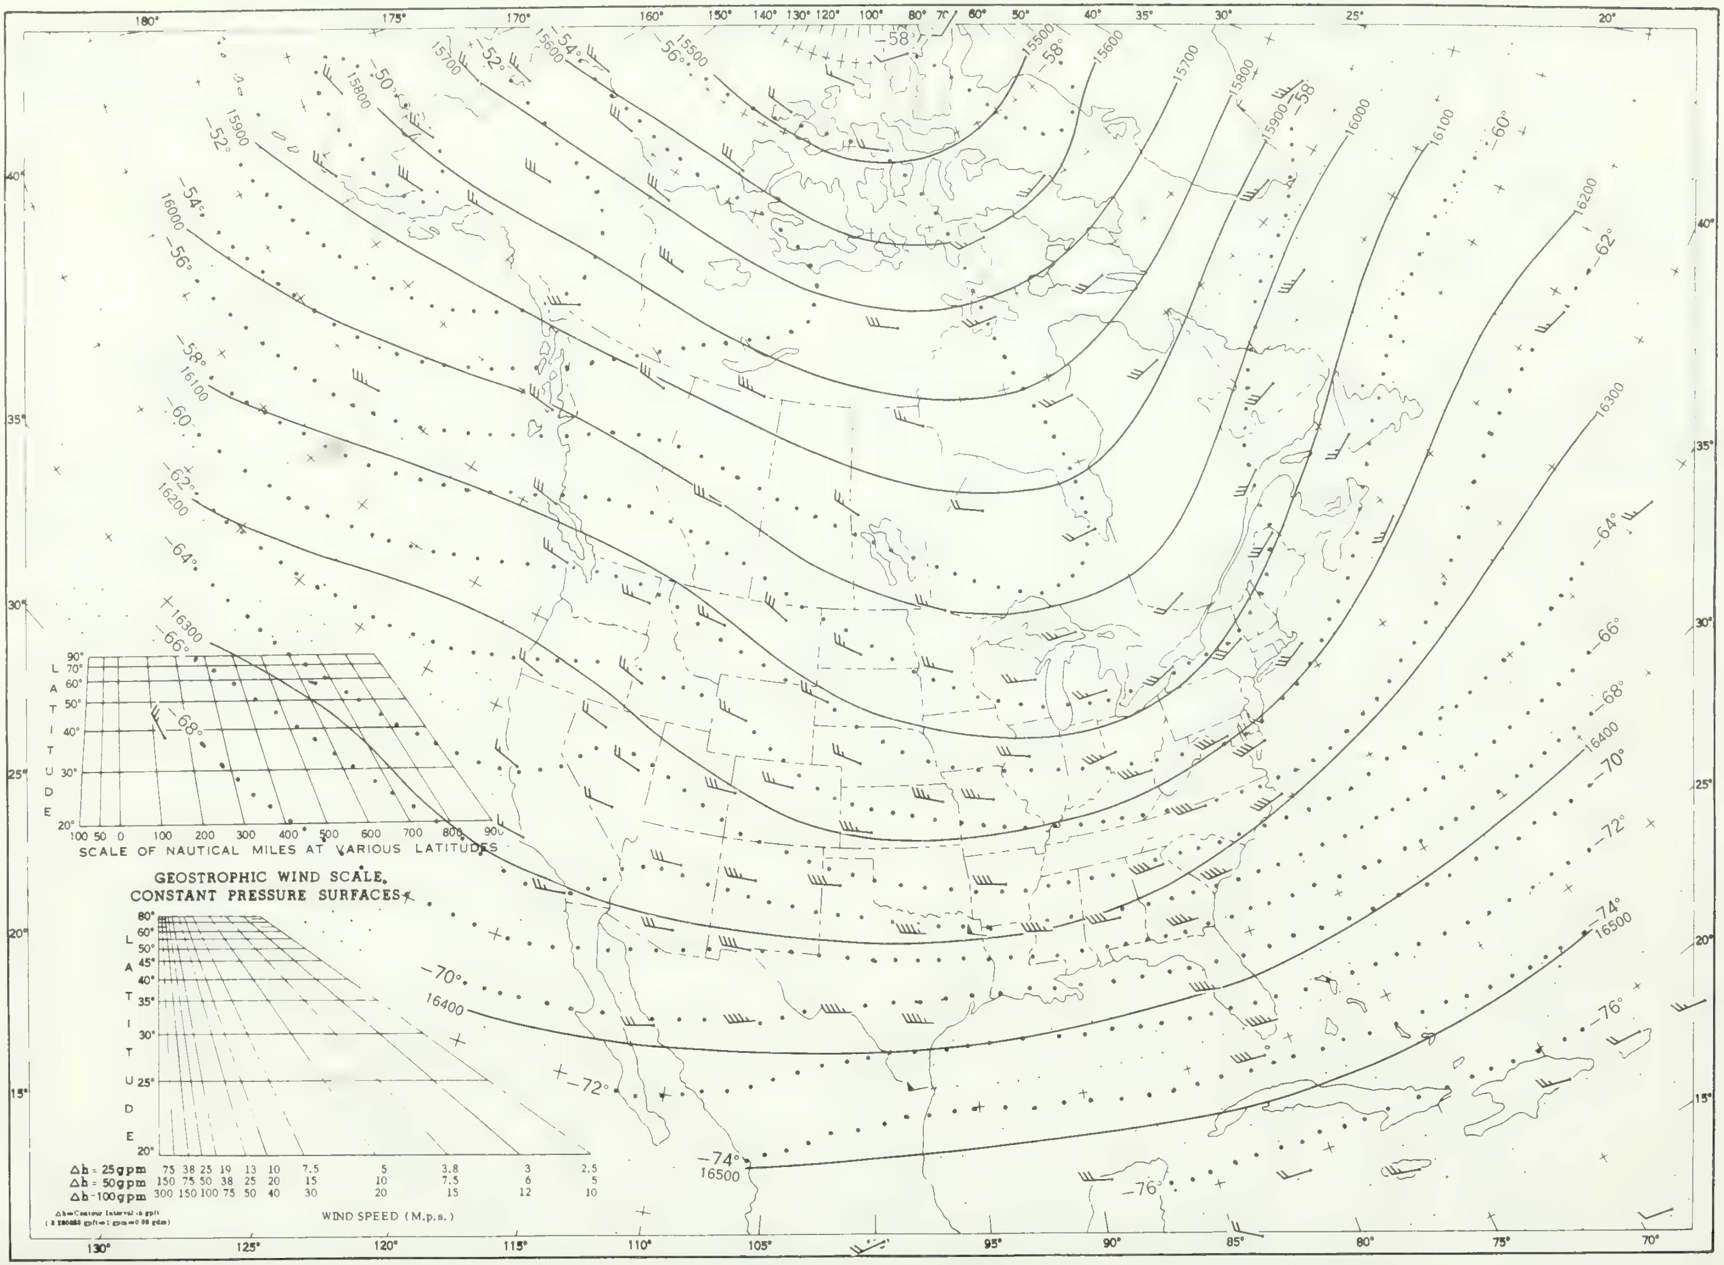
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV. 200-mb Surface, 1200 GMT, November 1969. Average Height and Temperature, and Resultant Winds



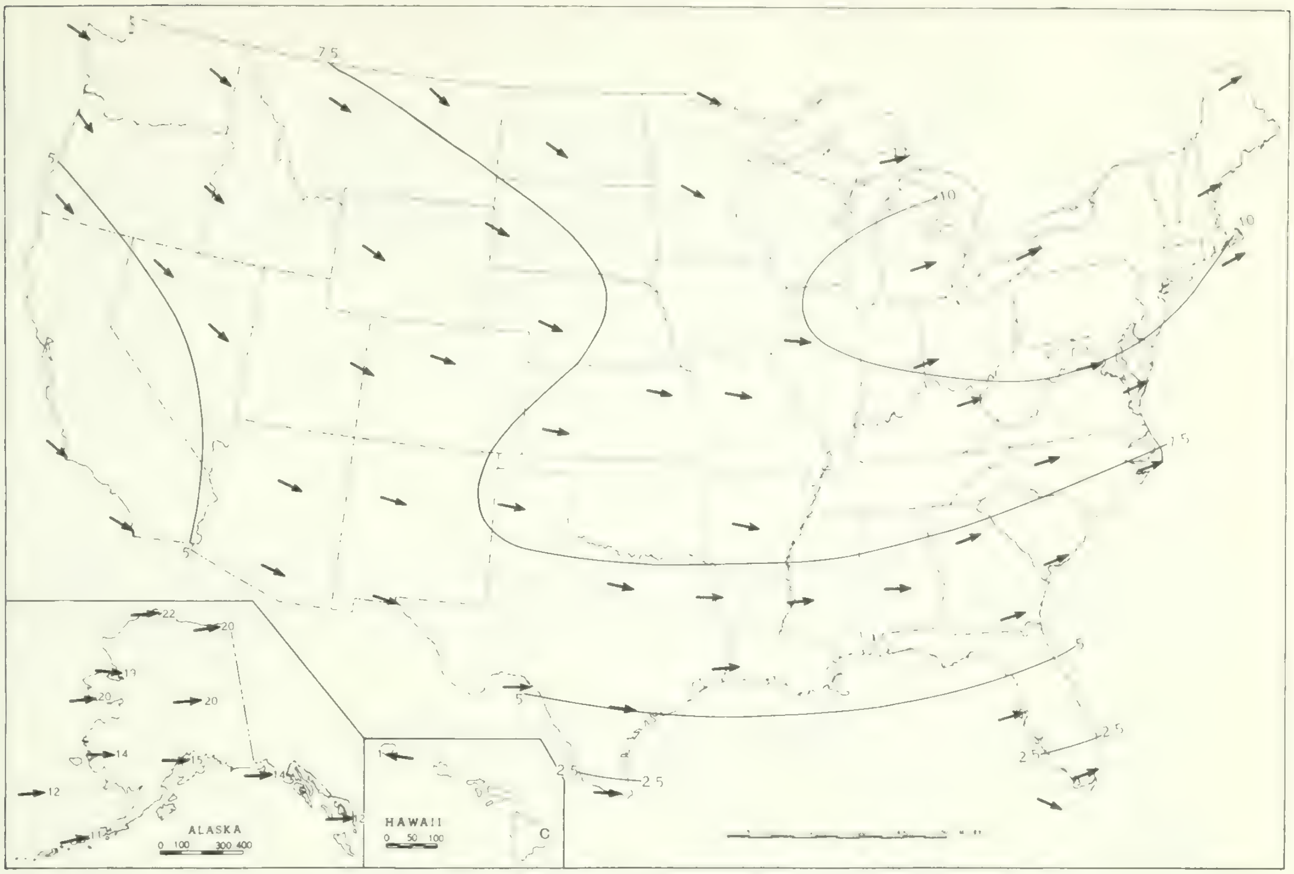
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI. 100-mb. Surface, 1200 GMT, November 1969. Average Height and Temperature, and Resultant Winds.

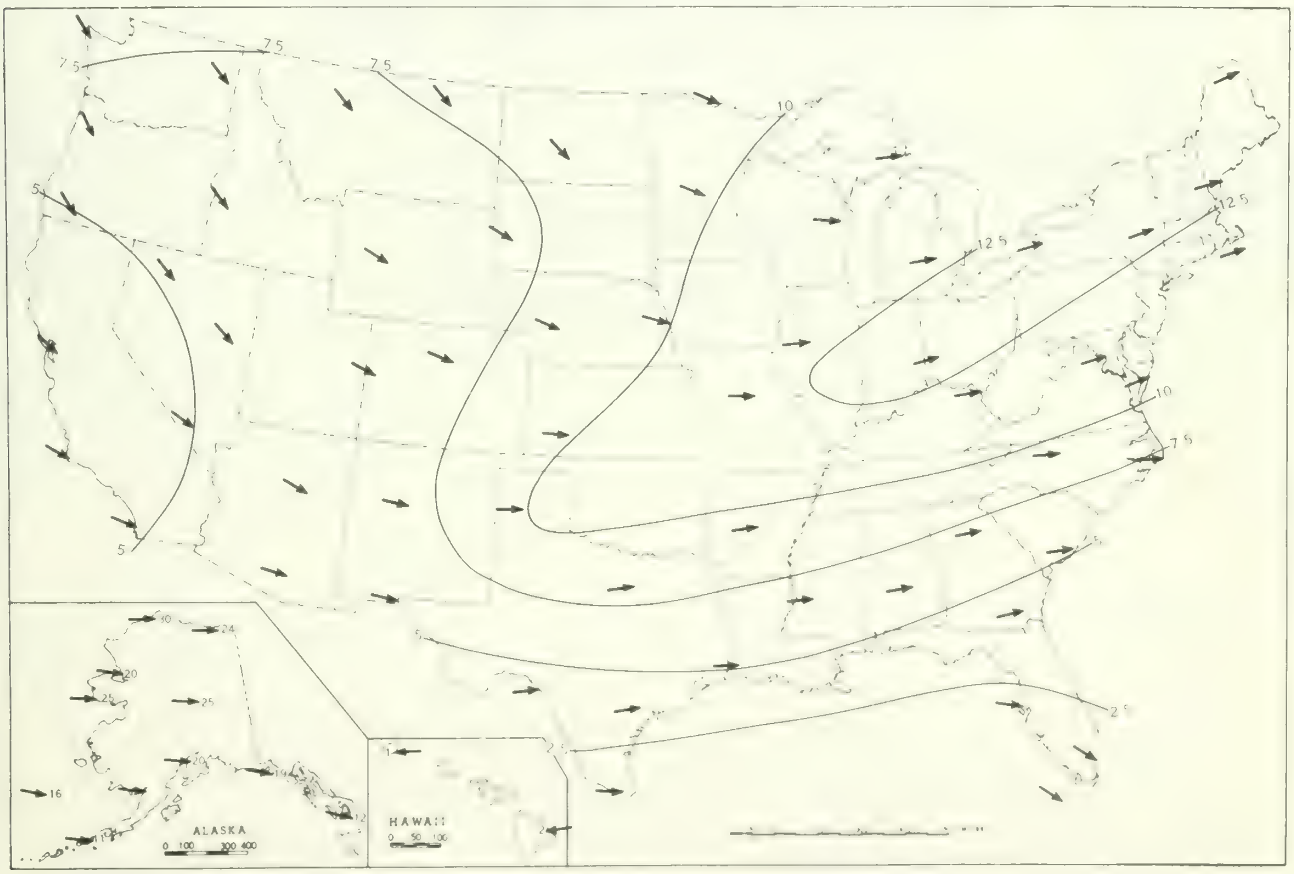


Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 GMT, November 1969. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, November 1969. Resultant Winds.



Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

DECEMBER 1969
Volume 20 No. 12

Asheville 1970

CONTENTS

NOTE: Delayed data and corrections will be carried in the June and December issues of this publication. An explanatory page "Description of Charts" will be carried in the January and July issues.

SUBSCRIPTION PRICE: Monthly 20 cents and annual 40 cents per copy; yearly subscription, including monthly and annual issues, $2.50 domestic, $3.50 foreign. Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to "Superintendent of Documents, Government Printing Office, Washington, D.C. 20402"

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 20 No. 12 DECEMBER 1969

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Precipitation totals ranged widely with many areas receiving above-normal amounts.
2. Warm temperatures prevailed in the West. The East averaged cooler than normal.

TEMPERATURE.--In general, temperatures averaged above normal from the Pacific Ocean to a line extending from Sault Ste. Marie, Mich., to central Nebraska, thence to Port Arthur, Tex., and below normal from that line eastward to the Atlantic Ocean. This is strikingly similar to the general temperature pattern in November. In the West, in December, a few small areas averaged more than 3° warmer than normal and a few small areas averaged slightly cooler than normal. In the East, a large area, which included the lower Missouri River Valley, the middle Mississippi River Valley, the Ohio River Valley and southeastward to the south Atlantic coast, averaged more than 3° colder than normal. Warm weather persisted in the West most of the month. The main exception was in the Northwest where the warm spell began with the second week of December. A cooling trend late in the month dropped temperatures sharply in the West, with subzero weather occurring in the central Rocky Mountains and subfreezing temperatures reaching the Mexican border near Douglas, Ariz.

Below-normal temperatures prevailed in the East throughout the month except in the second week when the Northeast averaged 3° to 18° warmer than normal, the departures increasing from Pennsylvania to northern Maine. Monthly temperatures in Maine averaged 3° to 6° above normal. After mid-December, the East became progressively colder until Christmas Day which, at some locations, was the coldest Christmas of record.

PRECIPITATION.--Many areas received above-normal rainfall in December. A few spots--the southwestern deserts, central Montana, southeastern Wyoming and nearby parts of Colorado and Nebraska, and southeastern Lower Michigan--received less than half their normal rainfall amounts. In contrast, southeastern Oregon, nearby parts of California and Nevada, and a number of areas in the Great Plains and the East received more than twice their normal December rainfall. Amounts ranged widely from no rain or light sprinkles in the southwestern deserts to more than 12 inches along portions of the northern Pacific coast. A large area from southeastern Texas to New England received from 4 to 6 inches or more of rain.

Rainy weather persisted along the north Pacific coast most of the month. Rains fell along the coast and in the nearby valleys with snow in the nearby mountains above about 3,000 feet in Washington and above 5,000 feet in parts of California. By the end of the month, snow depths had reached 50 to 80 inches in the Cascades.

About the middle of the first week of December, light snow fell in the northern and central Rocky Mountains and western Great Plains, with locally heavy accumulations of up to 7 inches in northwestern Kansas and to 9 inches in northern Missouri. Heavy snow fell from Minnesota to western New England in the first week of December, accumulating to about 20 inches at Duluth, Minn., 6 to 12 inches in Wisconsin, 12 inches in northeastern Ohio, 2 to 8 inches in New York, and 6 inches in western Connecticut. Generous rains, 2 to 4 inches, fell in the Southland from eastern Texas to western Alabama.

Stormy weather prevailed over much of the Nation in the second week of December. More rain and snow fell in the Pacific Northwest and snow fell across the Rocky Mountains to the upper Great Lakes. Rain fell in the central Great Plains, the lower Mississippi River Valley, along the Gulf of Mexico from Texas to Florida, and in the Atlantic Coast States. Tornadoes struck central Florida and generous precipitation fell in the Northeast with heavy snow at midmonth. More snow fell from Wisconsin and Indiana to New England in the third week of December. Rain or drizzle occurred in the Southeast.

The last week was especially stormy, particularly on Christmas Day when cold rain fell along the Pacific coast, tornadeos occurred in the Deep South, and heavy snow fell in the central Appalachians and began in the Northeast. The storm in the Northeast continued for several days, producing 20 to 28 inches of snow from the Finger Lakes to the Hudson and Champlain River Valleys and 2 to 4 feet in Vermont. Winds gusting to 50 m.p.h. piled 30-foot drifts in parts of Vermont. This storm became one of the worst blizzards in the 20th century in the Northeast.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70°F. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Z Sun continuously below horizon.

See footnotes at end of table

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile' is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
\+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

Z Sun continuously below horizon.

See footnotes at end of table

° Includes crop damage
C Crop damage

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
\# Freezing drizzle and freezing rain, commonly known as glaze.
Ø For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, ESSA, monthly publication STORM DATA.

\+ Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5,000,000
7 $5,000,000 to $50,000,000
8 $50,000,000 to $500,000,000
9 $500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS
DECEMBER 1969

Elmer R. Nelson, Office of Hydrology

The most significant flooding during December occurred in Maine and in Kentucky.

In Maine, the flooding on the Kennebec River was the third highest of record. Extensive flooding occurred along the Androscoggin and Sandy Rivers. Many people were evacuated from low-lying areas along the Kennebec River. The overall flood damage in Maine was estimated at several millions of dollars.

In Kentucky, major flooding developed along the upper Cumberland River in the southeastern portion of the State. Crests were very near those of the major flood of March 1963. Homes and commercial buildings outside of the flood protective works received considerable water and flood damage. In most cases moveable equipment was removed because of flood warnings by the Weather Bureau.

ST. LAWRENCE DRAINAGE

Lake Erie--Heavy rains on the 10th and 11th on top of snowmelt saturated ground, caused some local flooding in parts of western New York, mainly in low-lying and poor drainage areas. In Buffalo, N. Y., some highway underpasses were temporarily closed due to high water.

Lake Ontario--Canaseraga Creek at Groveland, N.Y., reached bankfull stage on the 11th. About 1 foot of water flowed across route 258 west of Groveland, N.Y., on the morning of the 11th.

ATLANTIC SLOPE DRAINAGE

The third highest flood of record occurred on the Kennebec River at Augusta, Maine, on the 28th. The crest was nearly 9 ft. above flood stage. Extensive flooding also occurred on the Androscoggin and Sandy Rivers, and small brooks and streams in Maine. In eastern Massachusetts, some flooding was reported from most communities in the Greater Boston area. Most damage was due to flooded cellars. For the greater part, this was due to saturated grounds and overflowing culverts and storm sewers. There was also some small stream overflow. Several storms during the month brought precipitation totals to record or near record amounts over much of New England. More than half of the monthly totals occurred during the storm period from the 26th through the 28th. It began as snow, then changed to rain, bringing copious amounts to many sections of New England. In Maine, where most of the flooding occurred, amounts ranged from 1.5 to near 10 inches. The overall flood damage in Maine, as reported by the Governor was several millions of dollars. Many people were evacuated from low-lying areas along the Kennebec River where widespread flooding occurred in Gardiner, Hallowell, Augusta, and Skowhegan. At Phillips and Farmington, Maine, on the Sandy River, houses were evacuated, automobiles submerged, and some bridges washed out. This was the worst flooding in these areas in many years. Heavy rains up to 2.4 inches during the night of the 10th caused minor flooding along Neshaminy Creek in southeastern Pennsylvania. This same storm caused minor flooding along the Ramapo at Mahwah, N. J., and along the lower elevations of the Raritan and Millstone Rivers in central New Jersey. The Assunpink Creek at Trenton, reached, but did not exceed, flood stage on the 11th. A mixture of rain, freezing rain, and sleet ranging from 0.5 inch to 1.25 inches on the 30th caused the Rancocas Creek at Pemberton, N.J., to rise above flood stage on the 31st. It receded within its banks on January 1 after cresting 1 to 1.5 ft. above flood level.

The water content of the snowpack in the Susquehanna Basin at the end of the month was 3.75 inches. This was one of the heaviest snowpacks for this time of the year in many years. At Harrisburg, Pennsylvania, the total snowfall for December was 28 inches, an alltime high for the month.

Heavy rainfall on December 29-31 caused moderate flooding in the Upper James Basin in Virginia on December 31 to January 1. The rainfall averaged about 1.75 inches in the upper basin and 1 inch in the lower basin.

Heavy rainfall (up to 3 inches) on the 7-11th caused the Broad River at Blair, S. C., to rise above flood stage on the 11th. It receded below flood stage on the 12th after cresting 3 ft. above flood stage.

EAST GULF OF MEXICO DRAINAGE

Heavy rains on the 21st, 22d, 25th, and 26th caused the East Fork of the Tombigbee River at Fulton, Mississippi, to rise to bankfull stage on the 26th and 27th. Additional heavy rain on the 30th and 31st caused the Tibbee River at Tibbee, Mississippi, to rise above flood stage on the 31st. It receded below flood stage on January 2 after cresting 6.1 ft. above flood stage on January 1. The overflows were minor and no damage was reported.

The Pearl River at Jackson, Mississippi, rose above flood stage on the 31st. Increased discharges from Ross Barnett Reservoir kept the Pearl River above flood stage at Jackson for the first 10 days of January. The crest on January 7 was 5 feet above flood stage. The overflow was confined to low-lying farmland and timberland adjacent to the river.

MISSISSIPPI SYSTEM

Upper Mississippi Basin--A new record snowfall of 33.2 inches occurred at Minneapolis-St. Paul, Minnesota, during December 1969. The previous snowfall record of 28.7 inches occurred in December 1968. This year (1969), the snowfall was concentrated over the area from Minneapolis-St. Paul to Mankato to Rochester, whereas, in 1968, the area involved was from Minneapolis-St. Paul to Sioux Falls, South Dakota, to Beardsley, Minnesota, to Duluth, Minnesota.

Navigation on the Mississippi River ended at Minneapolis-St Paul on December 5, at La Crosse, Wisconsin, on December 7 and at Guttenberg, Iowa, on December 10.

Missouri Basin--Ice action in the Missouri River, as freezing developed, caused some local flooding in the Bismarck-Mandan, North Dakota, area on December 30 to January 1. Some overflow occurred at two marinas, resulting in total damages estimated at less than $1,000.

The James River near Columbia, South Dakota, rose to within 1 foot of flood stage on the 10th. There was some inundation of the low flood plain in the area. It receded slowly to near normal flow by the end of the month.

Ohio Basin--Rainfall in excess of 2 inches on the 29th-31st plus snowmelt produced flooding at all headwater points in the upper Monongahela Basin in West Virginia. Crests ranged from 1.7 ft. above flood stage on the Cheat to nearly 6 ft. above flood stage on the Tygart. The pool of Tygart Flood Control Dam rose 85 feet to contain the flood from the Tygart Valley

River. The heaviest intensity of rain occurred during the afternoon and night of the 30th. A heavy snow cover occurred over the entire area during December. There was a partial snowmelt over the basin on the 30th-31st, but up to 18 inches of snow still remained over the mountains above Elkins, West Virginia, and on the higher terrain over the Cheat Basin. A preliminary estimate of flood damages was placed at under $100,000. Considerable savings resulted from flood warnings issued by the Weather Bureau.

Moderate to severe flooding occurred in the upper Little Kanawha River in West Virginia on December 31 and January 1. The Greenbrier River at Alderson, West Virginia, crested 3.3 feet above flood stage on the 31st. The Elk River at Queen Shoals, West Virginia, rose to, but did not exceed, flood stage. Many places along the Coal River were flooded. The crest at Tornado, West Virginia, was 5.8 ft. above flood stage on the 31st. The Guyandot River crested 4.8 feet above flood stage at Logan, West Virginia. Some of the tributaries also overflowed. The Tug Fork of the Big Sandy River at Williamson, West Virginia, crested 6 feet above flood stage. The city of Williamson was protected by a flood wall but there was some flooding outside the wall. Some flooding also occurred on the Big Sandy River in Virginia. Most of the rain causing the flood occurred during the period from 1 p.m. on the 29th to 7 p.m. on the 30th. The rainfall ranged up to 4 inches in the headwater area of the Big Sandy. The snow on the ground on the 27th ranged from 4 to 8 inches over the Tug Fork to 22 inches in the headwater area of the Elk River at Waneta, West Virginia. The water equivalent of the snow varied from 0.6 inch at the mouth of the Elk to 3.5 inches at Waneta in the headwaters. The water equivalent over the other basins averaged about 1.5 inches. The rain melted several inches of the snow, adding to the precipitation total. Preliminary estimates of flood damage were placed at $ 3 million.

Minor flooding occurred on the North Fork and South Fork of the Kentucky River on the 30-31st. The crest at Hazard, Kentucky, was 4.3 feet above flood stage on the 31st. The crests at Jackson and Oneida, Kentucky, reached, but did not exceed, flood stage. Damage resulting from the overflow was small. One death resulted from the high water on the State Road Fork, a small branch of the upper Licking River.

General rains during the last 3 days of the month, totalling nearly 3 inches, caused minor flooding on the Barren and Green Rivers in Kentucky. Crests ranged from 0.8 foot above flood stage on the Green to 1.4 feet above flood stage on the Barren River. No damages were reported.

Major flooding developed along the upper Cumberland River in southeast Kentucky from the headwaters to the upper reaches of the Wolf Creek reservoir on the 30th. Crests in the upper Cumberland River were very near those of the major flood of March 1963. In the lower portion of the basin, the Red River at Port Royal, Tennessee, crested 1.8 feet above flood and the Harpeth River at Kingston Springs, Tennessee, crested 4.4 feet above flood level. This flooding was due to heavy rain (2 to 5 inches) on the 28-30th. Considerable flood damage was caused by the flood waters in southeastern Kentucky. Preliminary estimates place the damage at Williamsburg, Barbourville, and Pineville, Kentucky, at $1.2 million. Only minor damage was reported on the Harpeth and Red Rivers in Tennessee.

Heavy rain on the 28-30th caused 8.5 to 12.7 feet of flooding on the Elk and Duck Rivers in Tennessee. Several families in low and unprotected areas in Shelbyville, Tennessee, on the Duck River were evacuated. Only minor damage resulted from the high water. The main stem of the Tennessee was out of its banks at Whitesburg and Florence, Alabama, on December 31 to January 5 and at Gilbertsville, Kentucky from December 31 to January 9. The crests during January ranged from 3.2 feet above flood stage at Florence to 9.3 feet above flood stage at Whitesburg, Alabama.

White Basin--Minor flooding occurred on the Cache River at Patterson, Arkansas, on November 24 to December 4. The crest was 1.5 feet above flood stage on November 27. Heavy rain (4 to 5 inches) on December 28 through December 31 caused the Cache to rise above flood stage on December 31 and continued in flood to January 26. The crest on January 4 was 2.2 feet above flood stage. No damage resulted from the overflow.

Arkansas Basin--The heavy rain on December 28 through December 31 caused the Fourche La Fave River at Houston, Arkansas, to rise above flood stage on December 30. It receded below flood stage on December 31 after cresting 1.9 feet above flood stage. There was some flash-flooding of low areas along Rock and Fourche Creeks in southwestern and southern Little Rock, though not to the extent that occurred in January 1969. Only minor damage resulted from the overflow.

Red Basin--There were two rises on the Sulphur River at Hagansport, Texas, during December. The first rise occurred on the 7th and the second on December 28 to January 2. The crests on the 8th and 29th were 4.1 and 8 feet above flood stage. The flooding was minor and no damages were reported.

Minor flooding occurred on the Saline River at Benton, Arkansas, on the 29-30th. The crest on the 29th was less than 1 foot above flood stage. The Quachita River at Arkadelphia, Arkansas, rose 0.1 foot above flood stage on the 30th.

Lower Mississippi Basin--Heavy rainfall in excess of 4 inches on the 29-30th caused the Big Black River at Bovina, Mississippi, to rise above flood stage on December 30. It receded below flood stage on January 17, after cresting 8.4 feet above flood stage on January 10. Flooding was confined to low-lying farmland and timberland adjacent to the river. No damage of consequences resulted from this overflow.

WEST GULF OF MEXICO DRAINAGE

There were two rises on the Calcasieu River at Hineston, Louisiana, during December. The first occurred on the 8-12th and the second on December 31 to January 11. The crests ranged from 1 ft. aboveflood stage to 2.7 feet above flood stage on February 3. The flooding was very light and no damages were reported.

Minor flooding occurred on the upper Sabine River at Mineola, Texas, on December 30 to January 4. The crest on January 2 was 2.1 feet above flood stage. At Emory, Texas, the river reached bankful stage on the 29th but did not exceed flood stage.

Excessive rains over the Navasota Basin on the 6th and 7th caused flooding near Easterly, Texas, on the 7-11th. The crest on the 8th was 2.6 feet above flood stage. The flooding was minor and no damage was reported.

Heavy rains over the upper Trinity Basin early in December caused Richland Creek at Richland, Texas, to rise to bankfull stage on the 6th and 7th. Chambers

Creek near Corsicana, Texas, rose to near bankfull stage on the 7th. A sharp rise occurred on the Trinity at Long Lake, Texas, from the 6th to the 9th but no flooding resulted.

Strong northwesterly winds, gusting to about 50 m.p.h. on the 6th, raised waves on Lake Corpus Christi in lower Nueces Basin, spilling water over Wesley Seale Dam. The water level rose to near 11 feet at the bridge below the dam. Only slight flooding occurred.

THE GREAT BASIN

Heavy precipitation caused flooding on the lower Carson River in Nevada on the 16-18th and again on the 22d. Occasionally, heavy rain at high elevations in the Sierras resulted in some flooding on the Truckee River on the 21st and 22d. The Truckee reached a flow of about 7300 c.f.s. at Reno, Nevada, on the morning of the 22d. There were no reports of any damage.

PACIFIC SLOPE DRAINAGE

Sacramento Basin--A series of warm storms moved across central and northern California beginning during the second week of December. Several rises moved down the Sacramento River after the middle of the month. Some flooding occurred in the low sloughs and over some roads in low areas adjacent to Tehama Bridge and below the trailer park at Woodson Bridge, California. Highways east of Red Bluff were covered with water on at least two occasions from the overflow of streams. There were several stations where warning stages were reached or exceeded, including all weirs. The flooding of the bypass system below Colusa and Tisdale Weirs caused minor inconveniences to agricultural interests, even though flow into the bypass is generally expected during this time of the year. There were 5 deaths from the high water, mostly in the bypass areas.

Eel Basin--Heavy rain on the 18-21st caused flooding on the Van Duzen River at Bridgeville, California, on the 21st. The river began rising on the 20th and crested nearly 3 feet above flood stage at 9 a.m. on the 21st. It receded below flood stage by noon on the same date. Flooding occurred along Highway 36 at Bridgeville, at Grizzly Creek State Park, and at Starvation Flat, where about 20 families resided. There was some damage to agricultural land and levees.

The storms producing the precipitation were quite warm as they moved in from the west to the northwest. The first significant storm moved across the basin on the 7-8th. A family of storms followed with intermittent clearing between them. Measurements at the rain gage just east of Grizzly Creek State Park indicated a total of at least 12.3 inches of rain over the basin from the 8th through the 21st. There were no less than 6.1 inches from the 18th through the 21st, of which about 3 inches occurred in less than 24 hours.

Coquille Basin--Heavy rain on the 19th through the 22d caused flooding on the South Fork at Myrtle Point, Oregon, and on the Coquille River at Coquille, Oregon. Maximum 24-hour rainfall amounts averaged 3 to 4 inches during this period. The total storm rainfall over the basin ranged from 6 to 7 inches. There were two crests on the South Fork at Myrtle Point. The first crest on the 21st was the higher of the two and was 7.6 feet above flood stage. The second crest on the 26th was 0.5 foot above flood stage. The Coquille River at Coquille, Oregon, crested 2 feet above flood stage on the 22d.

The damage in the affected area was light - approximately $25,000. One man fell from a horse and was drowned while trying to drive some cattle to higher ground after dark.

COLUMBIA BASIN

Except for the first 4 and the last 3 days of December there was daily measurable precipitation at all stations in western Oregon. There were several instances when heavy precipitation produced rises along the Willamette and its tributaries. A potentially serious flood event was prevented as the freezing level remained low. December precipitation was about 150% of average throughout western Oregon, but natural streamflow of the Willamette River at the mouth was only 85% of the 15-year average.

The first minor rise on the Willamette tributaries occurred on the 11-13th. The more significant rise followed the heavy rain on the 20th-21st which ranged from 2 to 2.5 inches. The Pudding River at Aurora, Oregon, crested 3.2 feet above flood stage on the 24th and Johnson Creek at Sycamore, Oregon, crested 0.1 foot above flood stage on the 21st. The following streams crested at or slightly above bankfull stage:

McKenzie River near Coburg, Oregon
Marys River near Philomath, Oregon
Santiam River at Jefferson, Oregon
South Yamhill River near Whiteson, Oregon
Willamette River at Harrisburg, Albany, and Salem, Oregon

The Corps of Engineers estimated the damages from the overbank flows at $32,200.

Note: All observations scheduled at 1200, G. C. T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i. e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

\+ Observations for these stations are scheduled at 0000 G. C. T.

† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the surface and higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

Note.--Langley is the unit used to denote one gram calorie per square centimeter. Values with an asterisk are interpolated.

U Indicates Urban sites.

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

Note.--Langley is the unit used to denote one gram calorie per square centimeter.

Values with an asterisk are interpolated.

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a. m.) at Palmer, Alaska

DECEMBER 1969

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	-73	-54	-64	-65	-53	-76	-104	-97	-91	-134	-120	-87	-25	-24	-33	-94	-126	-81	-97	-159	-141	-158	-32	-93	-42	-44	-14	-32	-19	-59	-38	72

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the ESSA, Weather Bureau.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (< 3900 A) Ames, Iowa

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	5.92	5.62	6.31	5.92	2.27	1.28	2.36	7.20	4.34	7.00	7.00	6.71	6.81	4.44	6.21	3.94	2.07	5.03	5.13	3.94	3.55	3.25	7.00	3.65	6.71	7.50	3.15	1.34	5.32	6.21	5.32	5.01

These data are from an U - V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the ESSA, Weather Bureau.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code $\lambda s \Omega \Omega \Omega$ defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

Station	Day of month																														
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O_3

Data will be delayed

The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded $\Omega \Omega \Omega$) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λs designates the type of measurement made.

SOLAR RADIATION TOTALS

page 341: Illinois

Month: June 1969

Storm Summary: Property damage by lightning should be category 6.

page 380: New Mexico

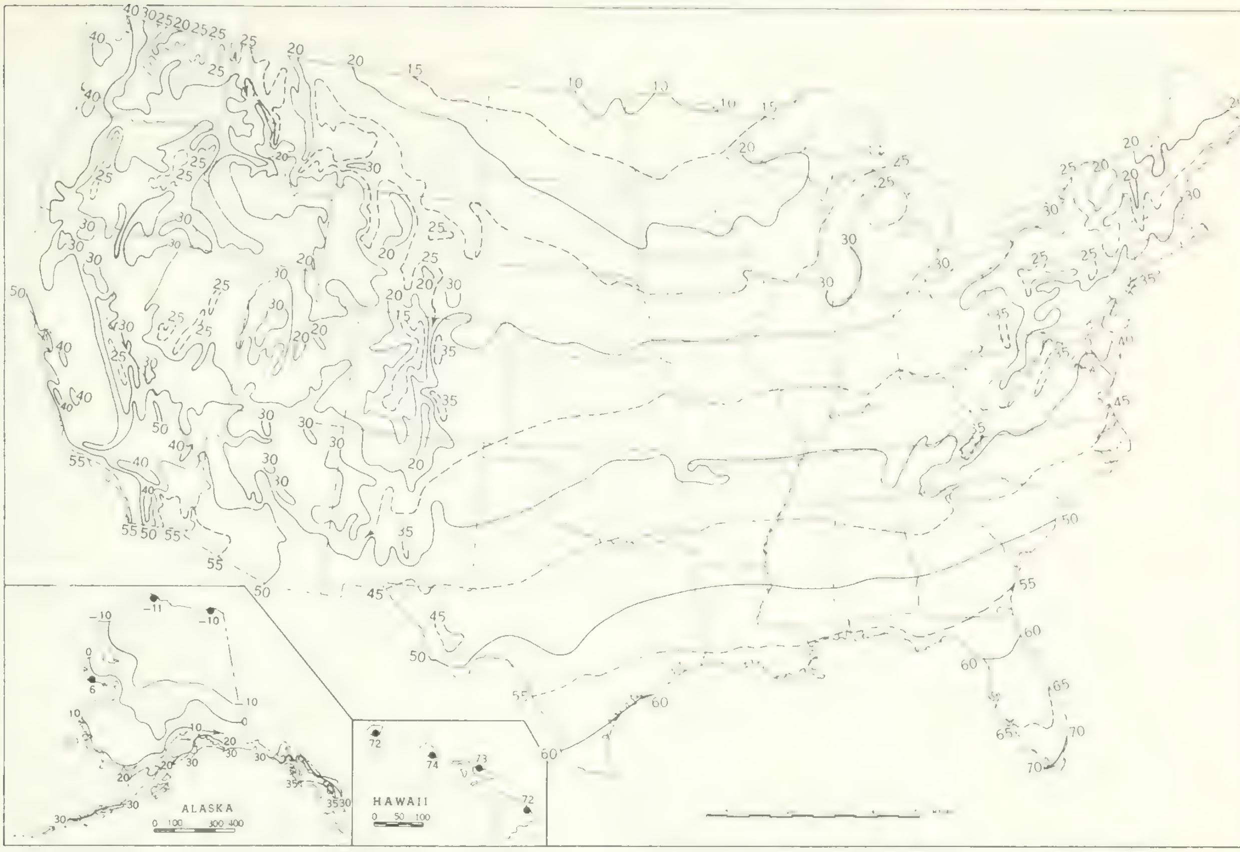
Month: July 1969

Condensed Climatological Summary: The greatest monthly extreme precipitation should be Chacon, 8.40.

1968 Annual

Page 69 - Frequency of Tropical Cyclones Reaching Hurricane Intensity by Months and Years. Sept. total should be 146.

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), December



B. Temperature Departure from 30 - Year Mean (°F 1931-60), December 1969.

Chart II. Total Precipitation (Inches), December 1969.

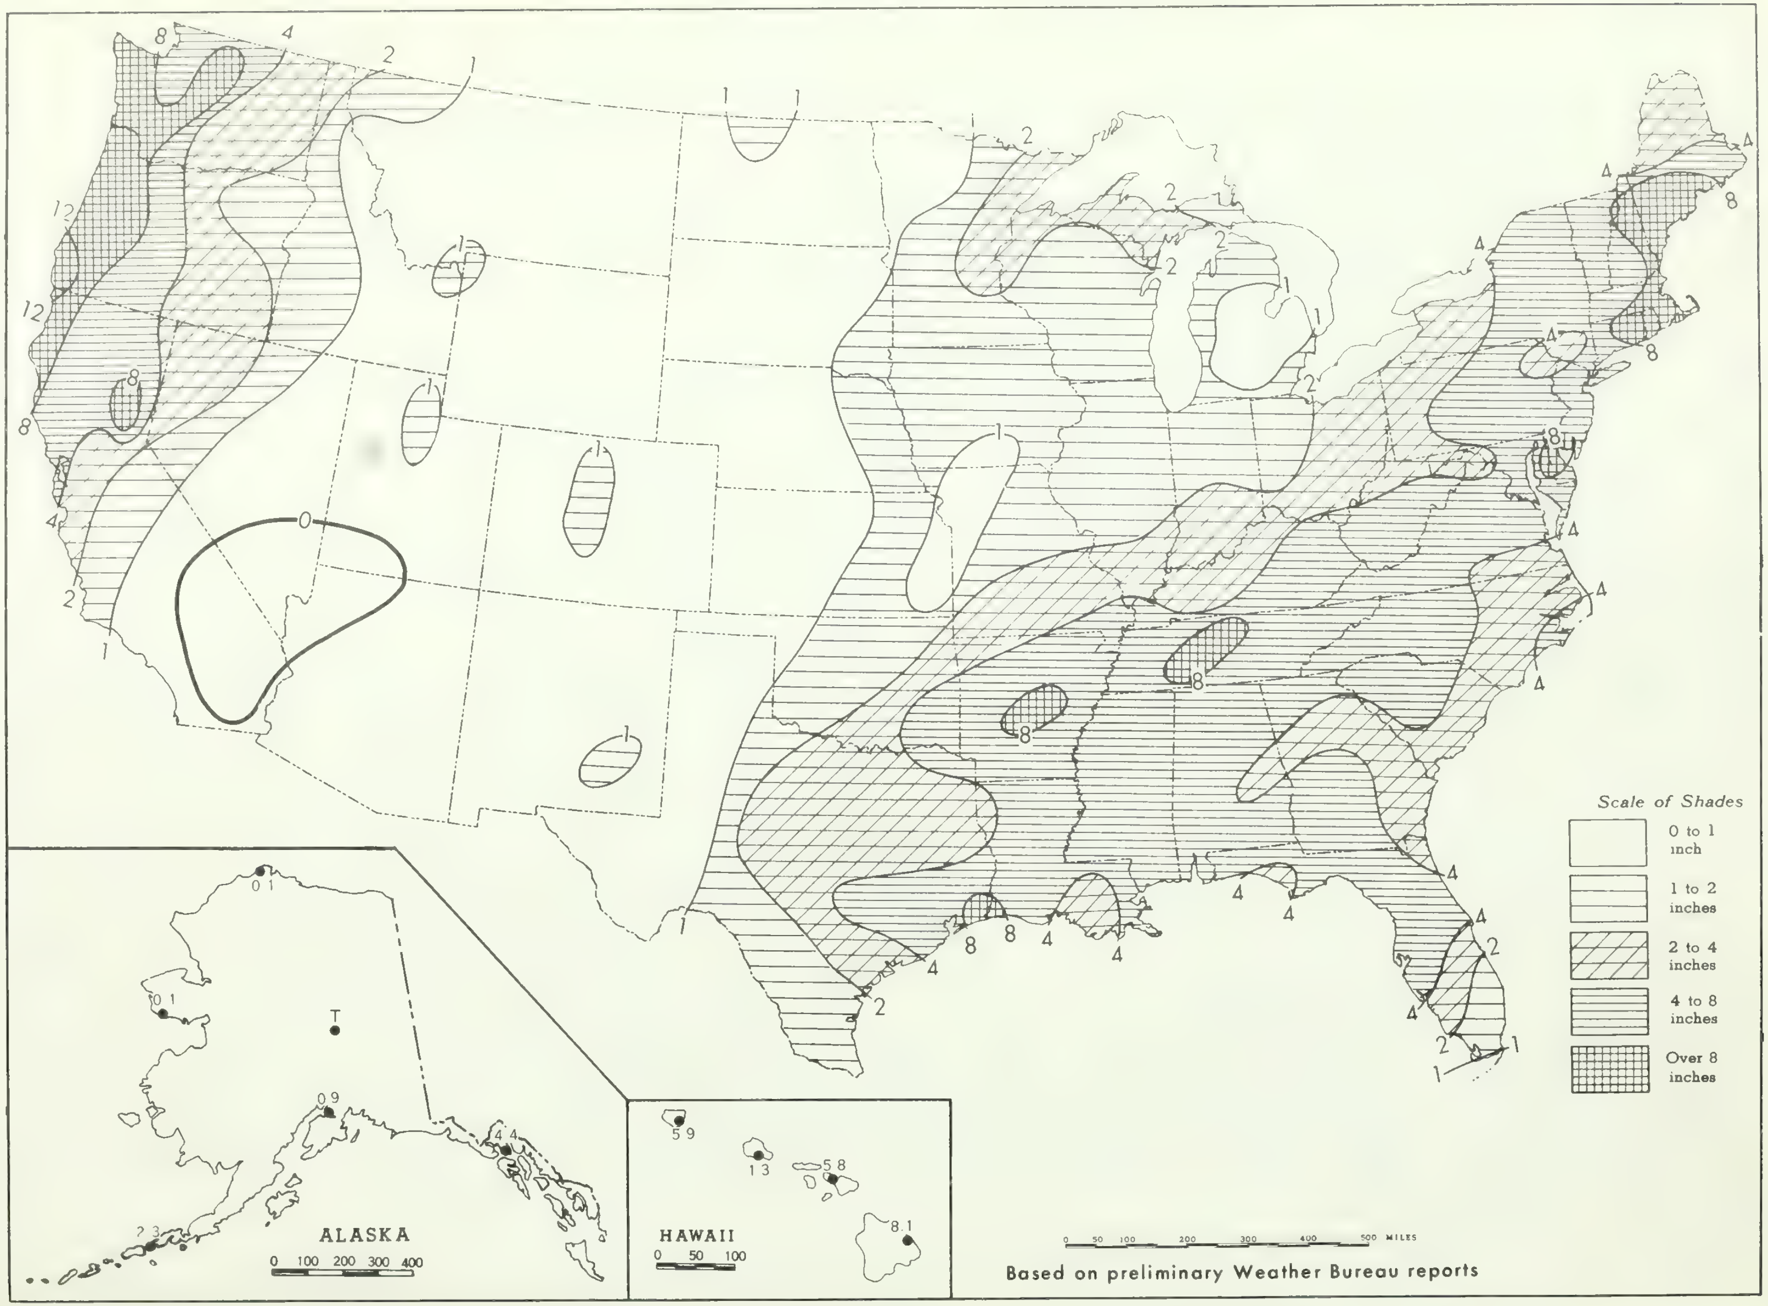


Chart III. Percentage of Normal Precipitation, December 1969.

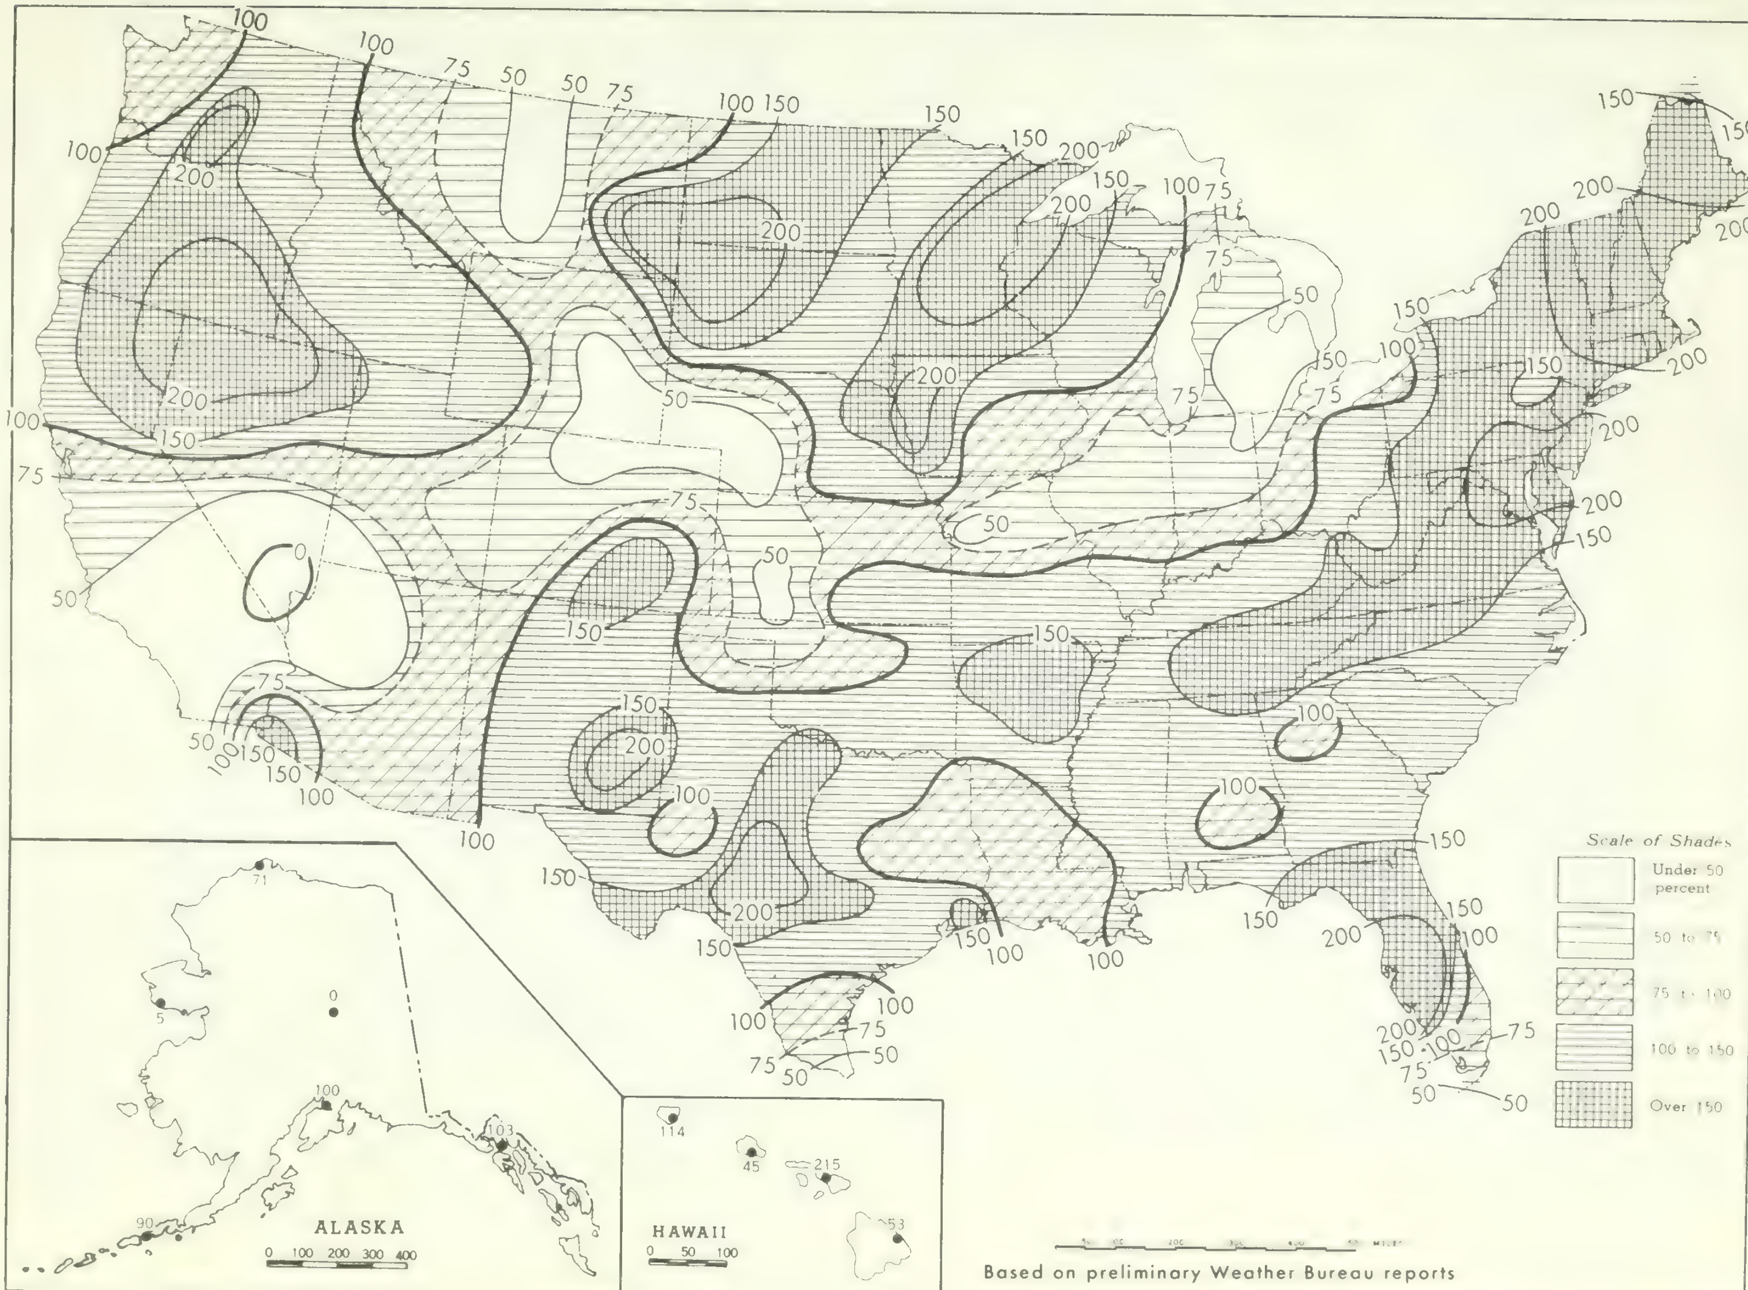

Chart IV. Total Snowfall (Inches), December 1969.

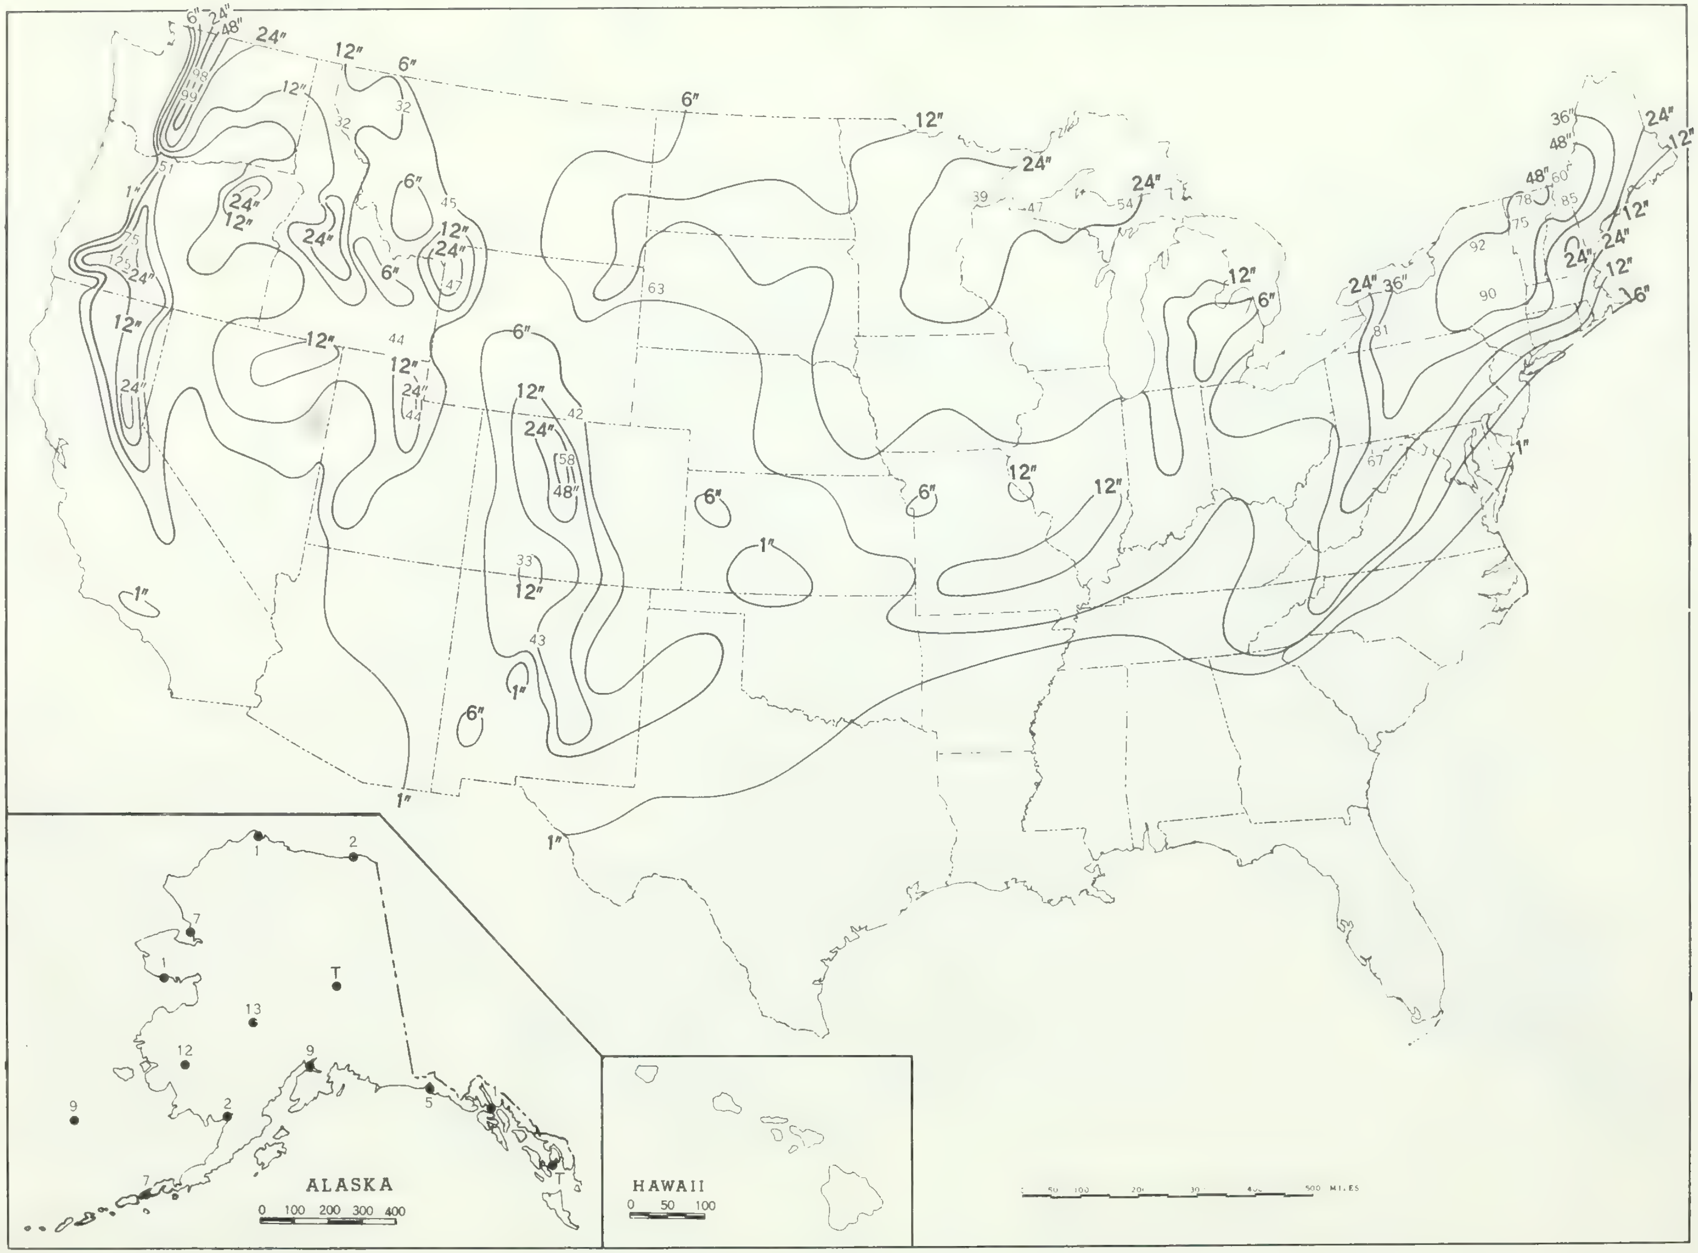
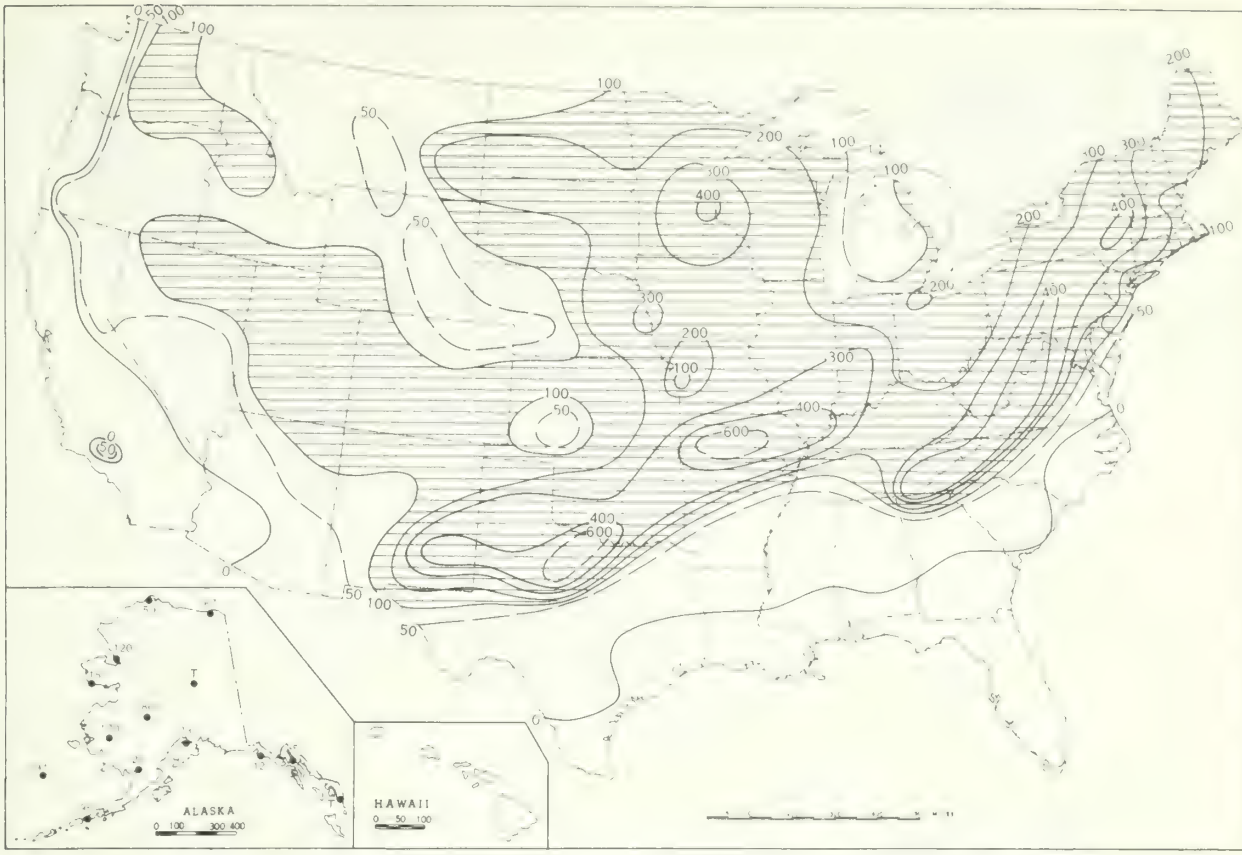
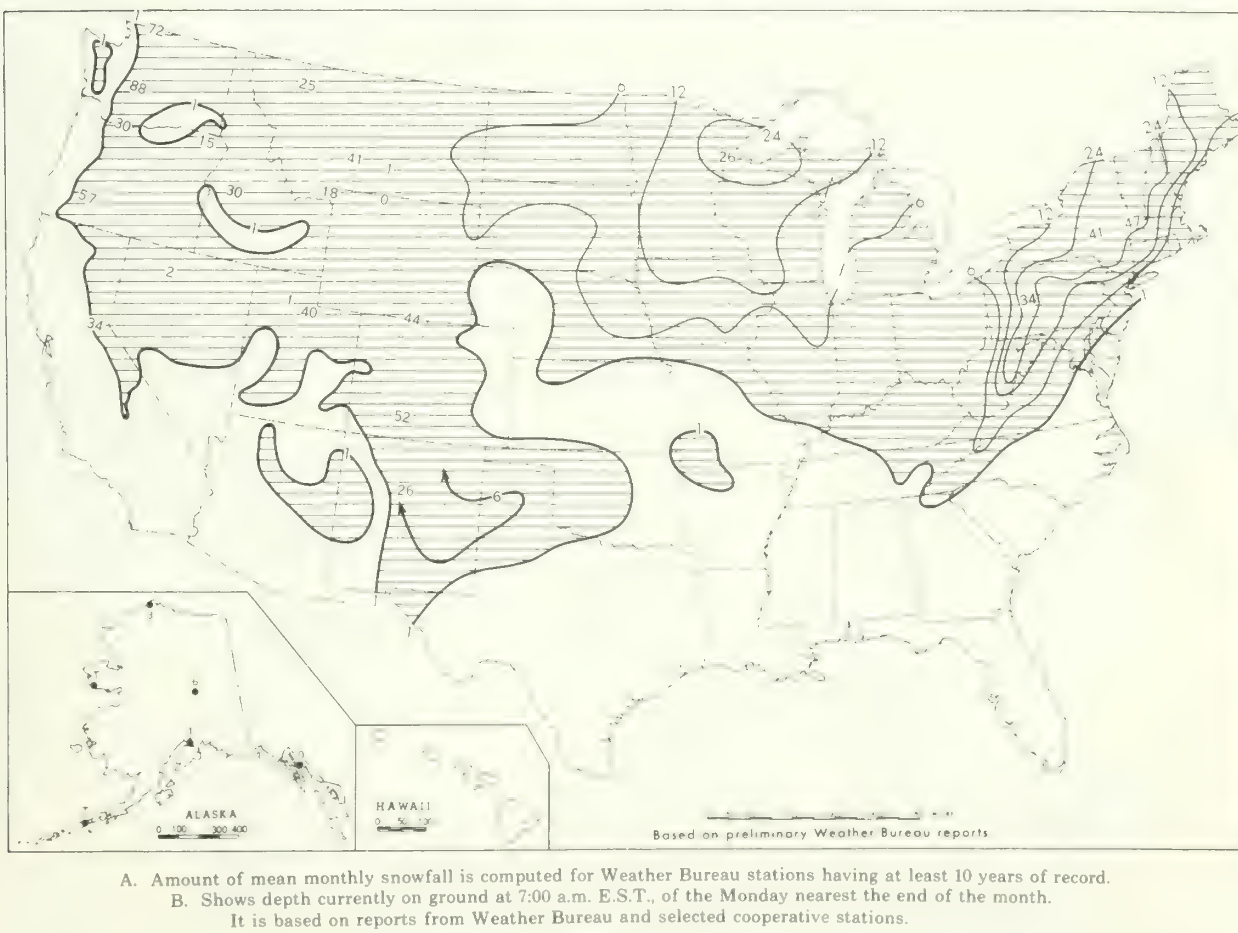


This is the total of unmelted snowfall recorded during the month at Weather Bureau and selected cooperative stations. This Chart and Chart V are published only for the months of November through April, although of course there is some snow at higher elevations, particularly in the far West, earlier and later in the year.

Chart V. A. Percentage of Mean Monthly Snowfall, December 1969.

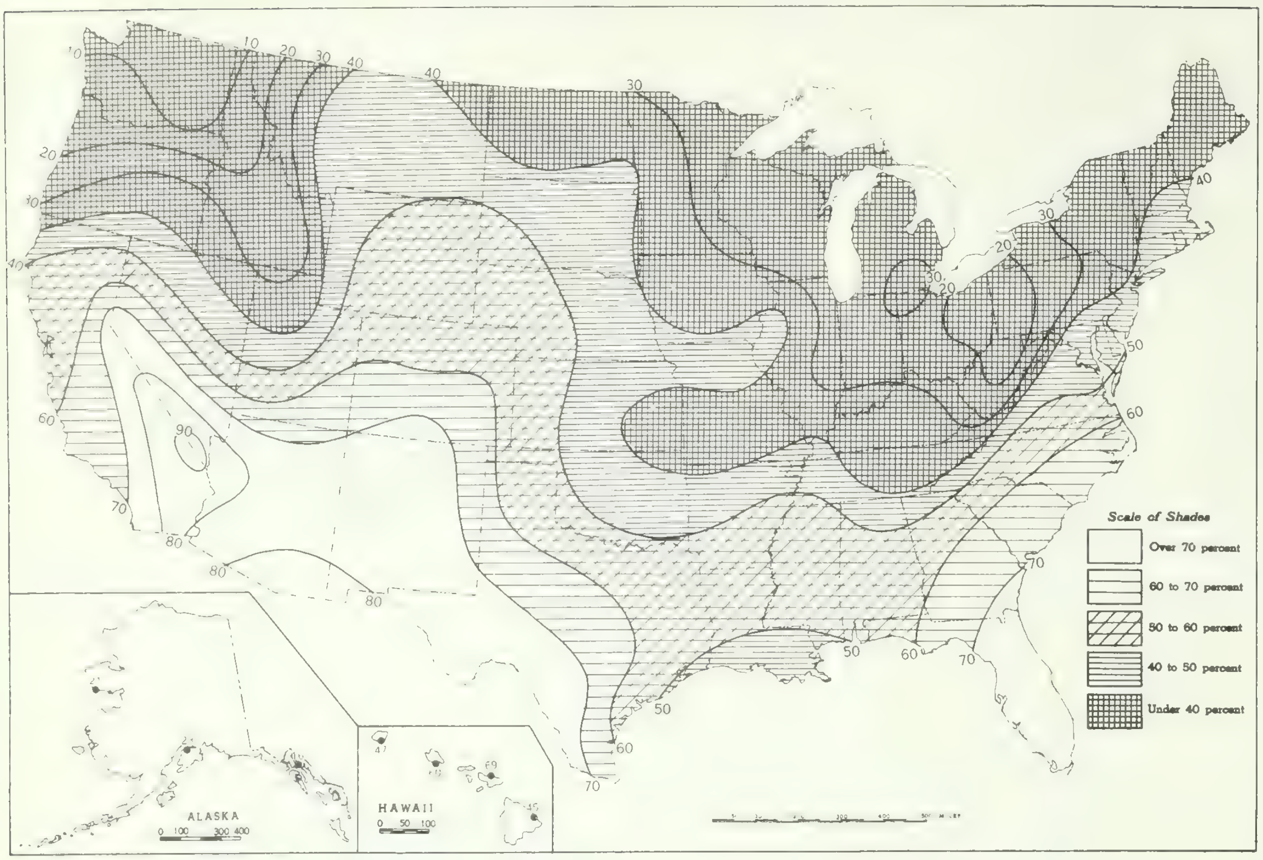


B. Depth of Snow on Ground (Inches), 7:00 a.m. E. S. T., December 29, 1969.

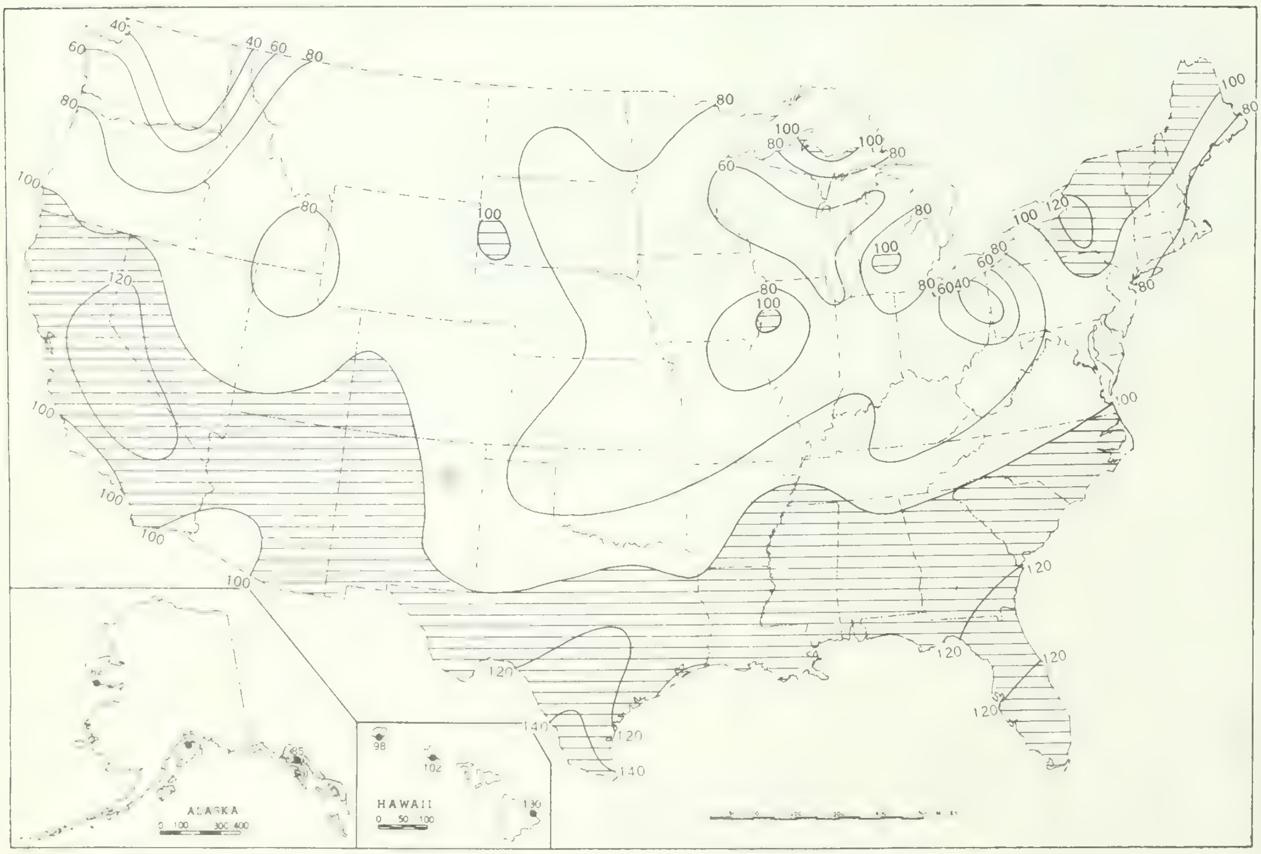


A. Amount of mean monthly snowfall is computed for Weather Bureau stations having at least 10 years of record.
B. Shows depth currently on ground at 7:00 a.m. E.S.T., of the Monday nearest the end of the month.
It is based on reports from Weather Bureau and selected cooperative stations.

Chart VI. A. Percentage of Possible Sunshine, December 1969.

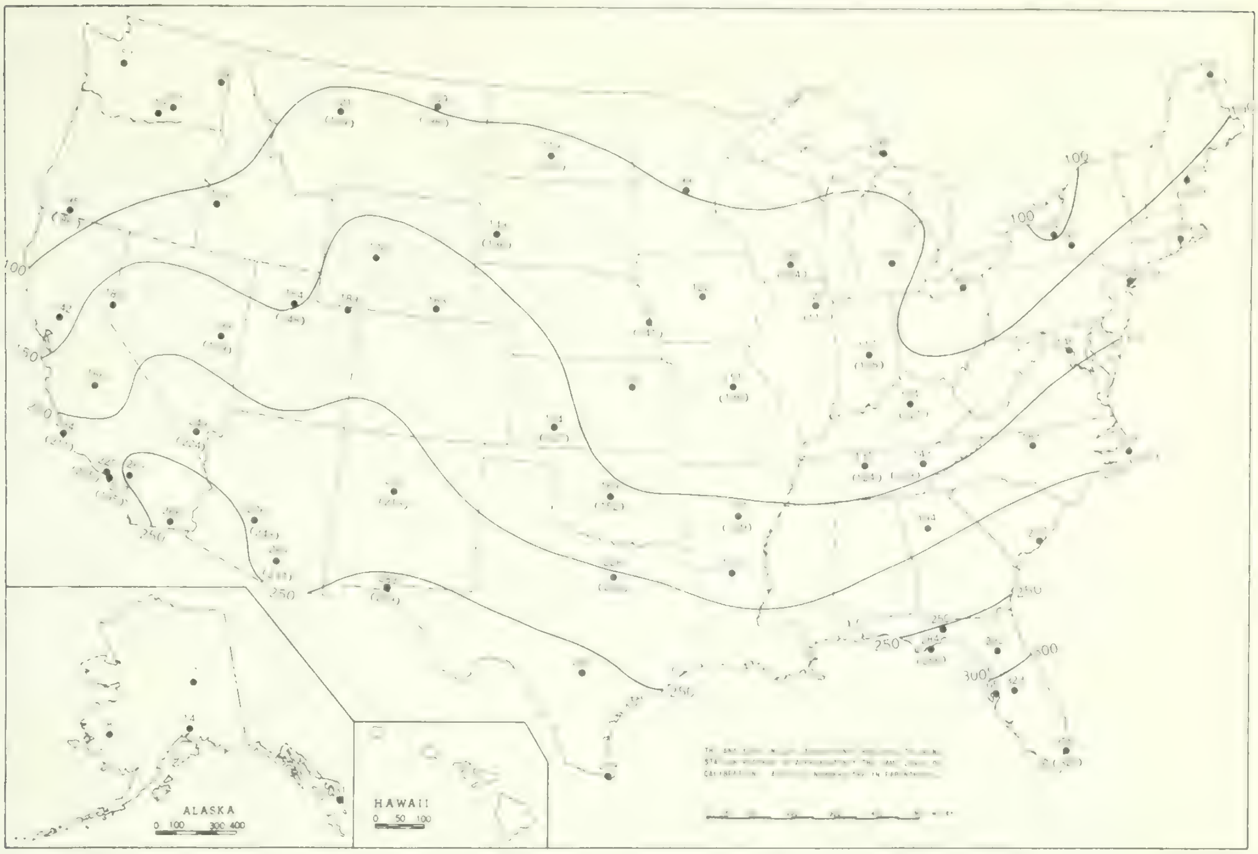


B. Percentage of Mean Monthly Sunshine, December 1969.



A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

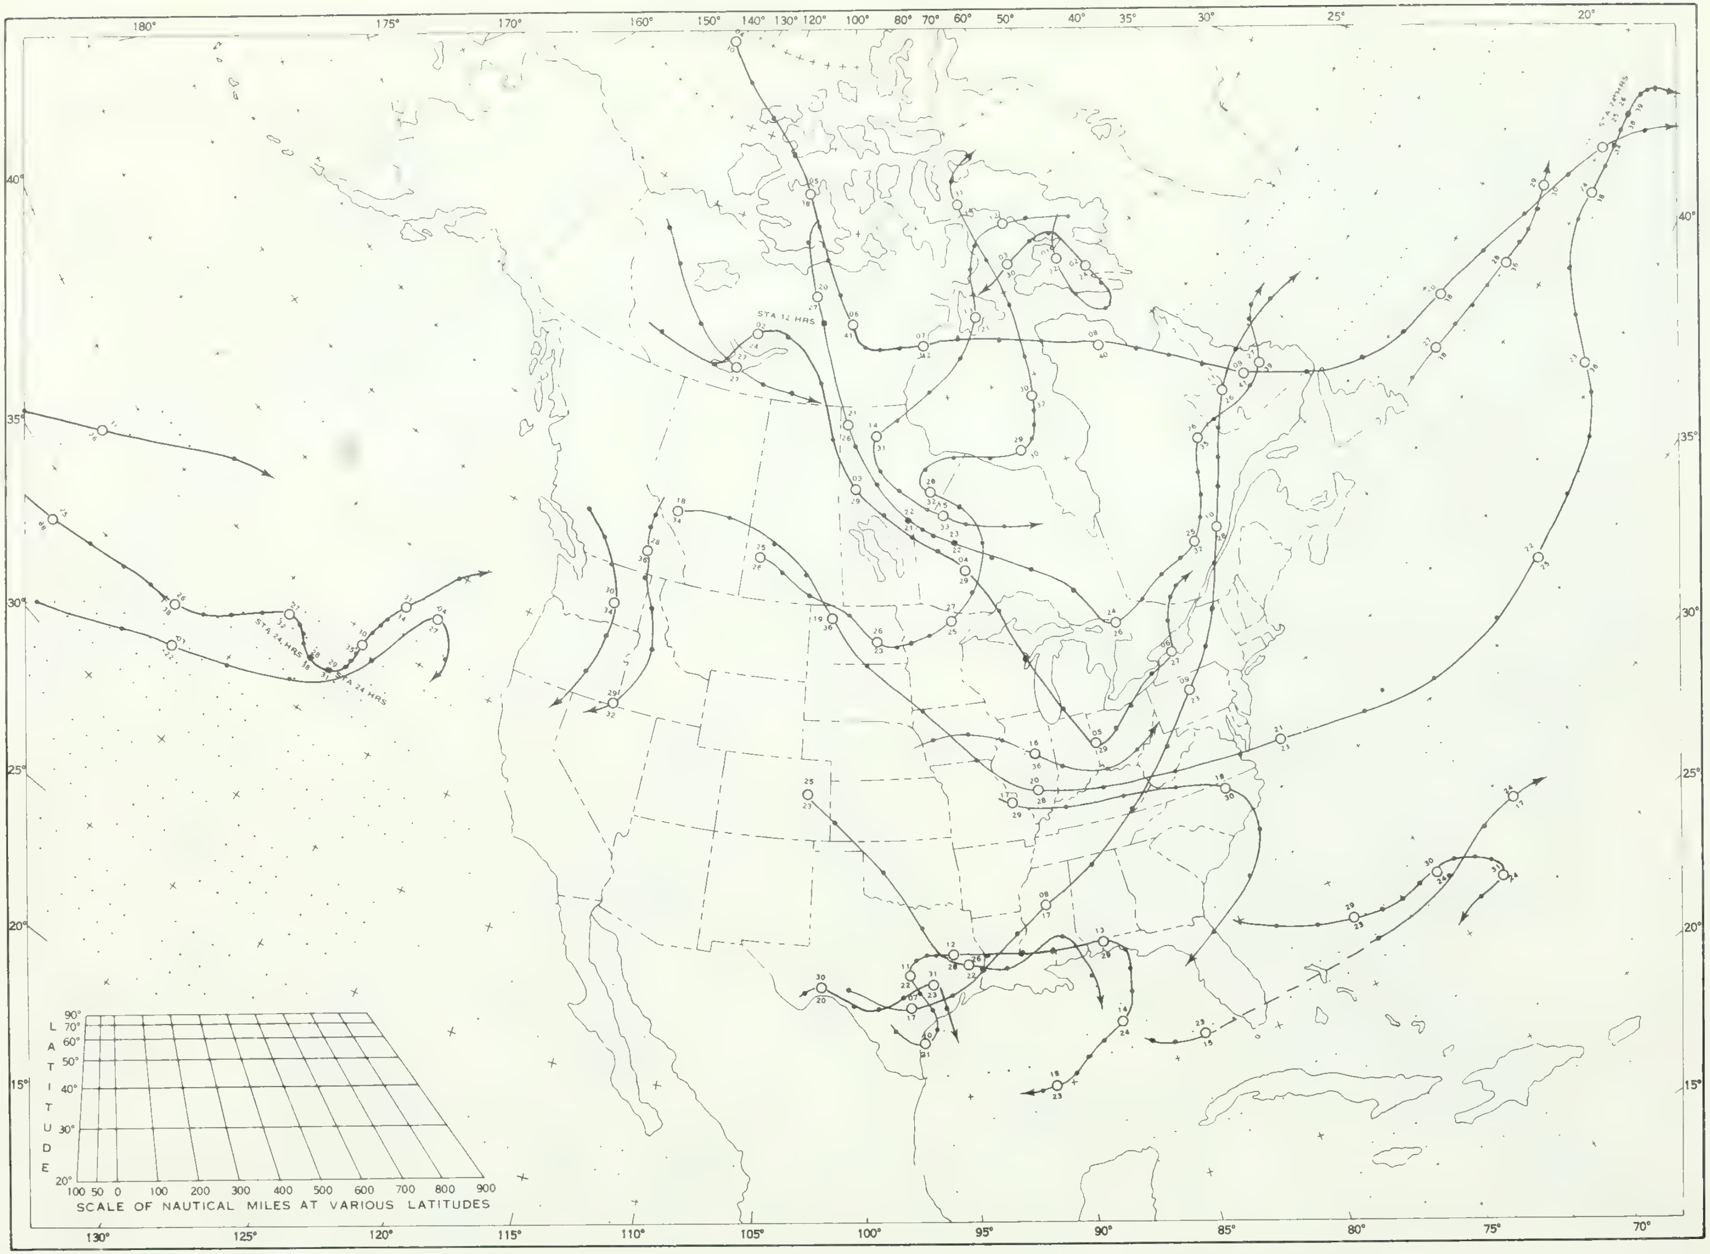
Chart VII. A. Average Daily Values of Solar Radiation, Langleys, December 1969.



B. Percentage of Mean Daily Solar Radiation, December 1969.

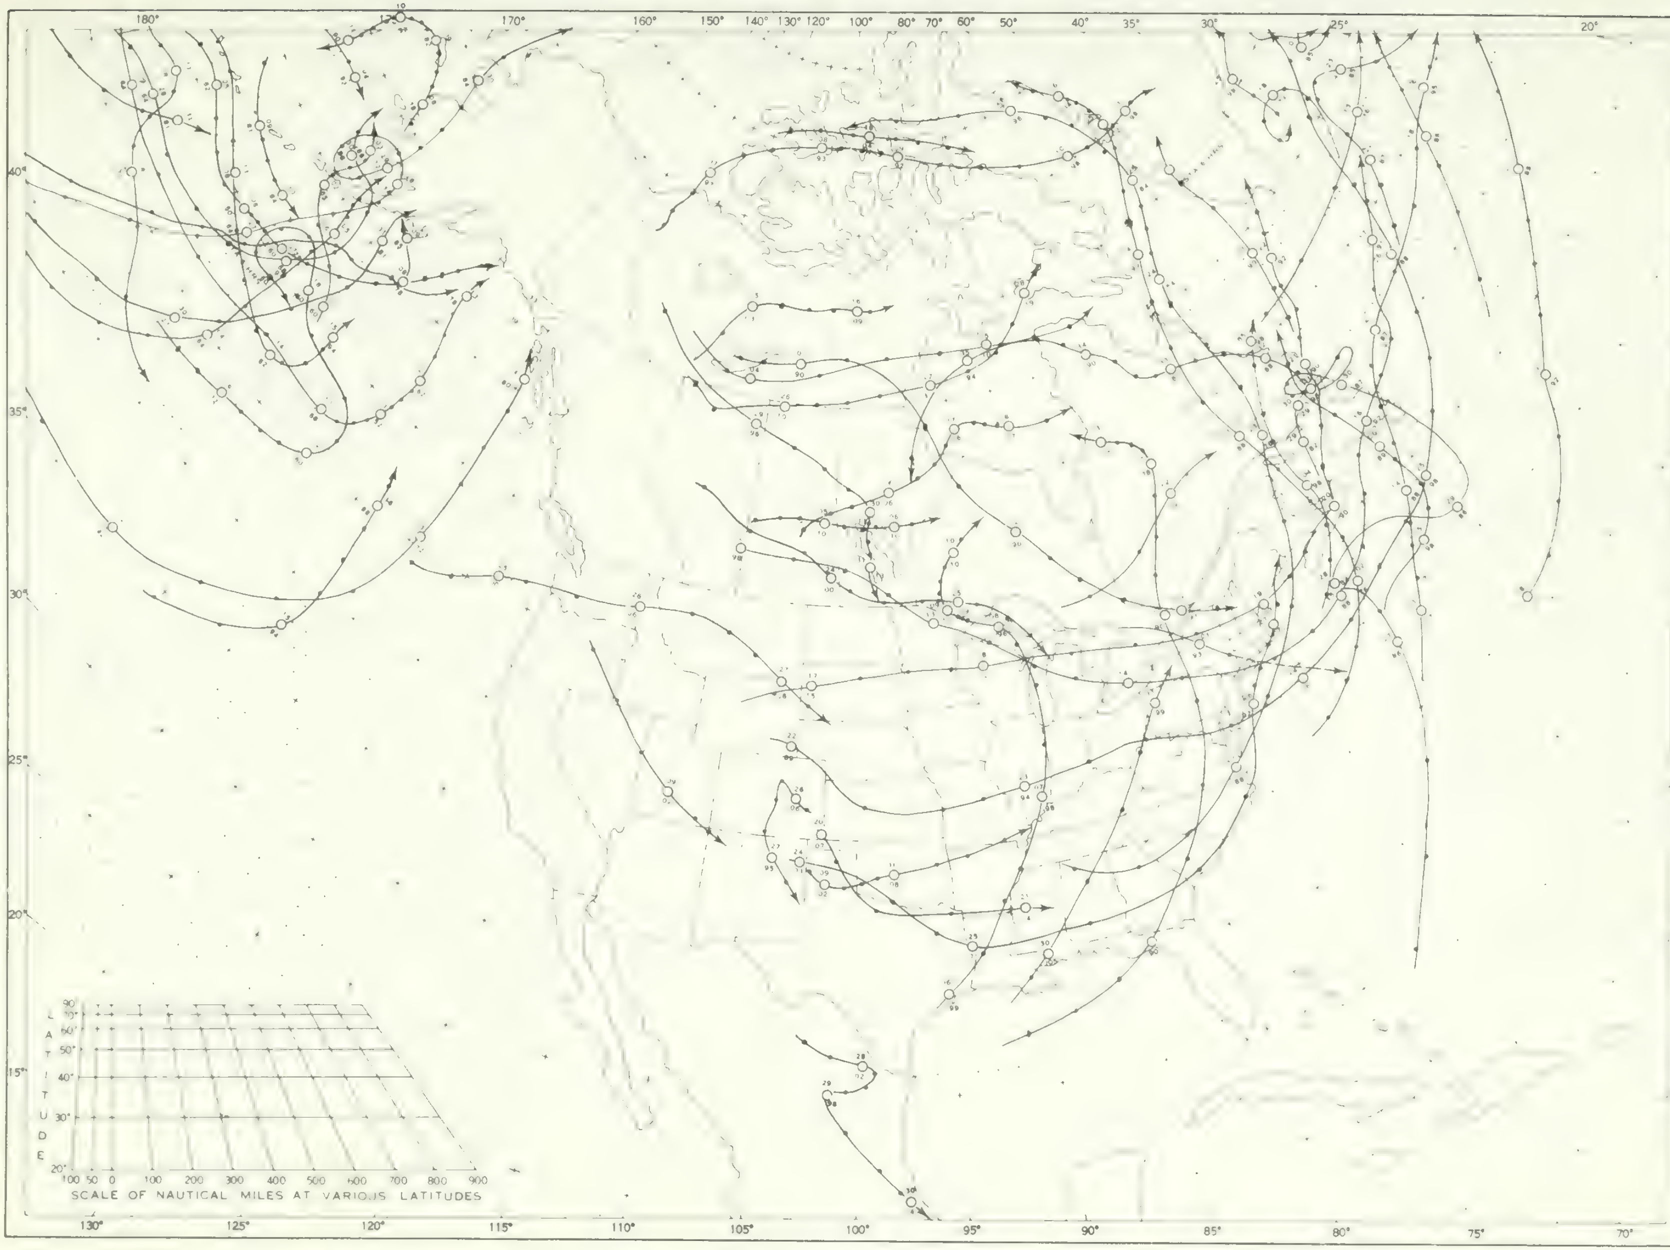
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm. $^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, December 1969.



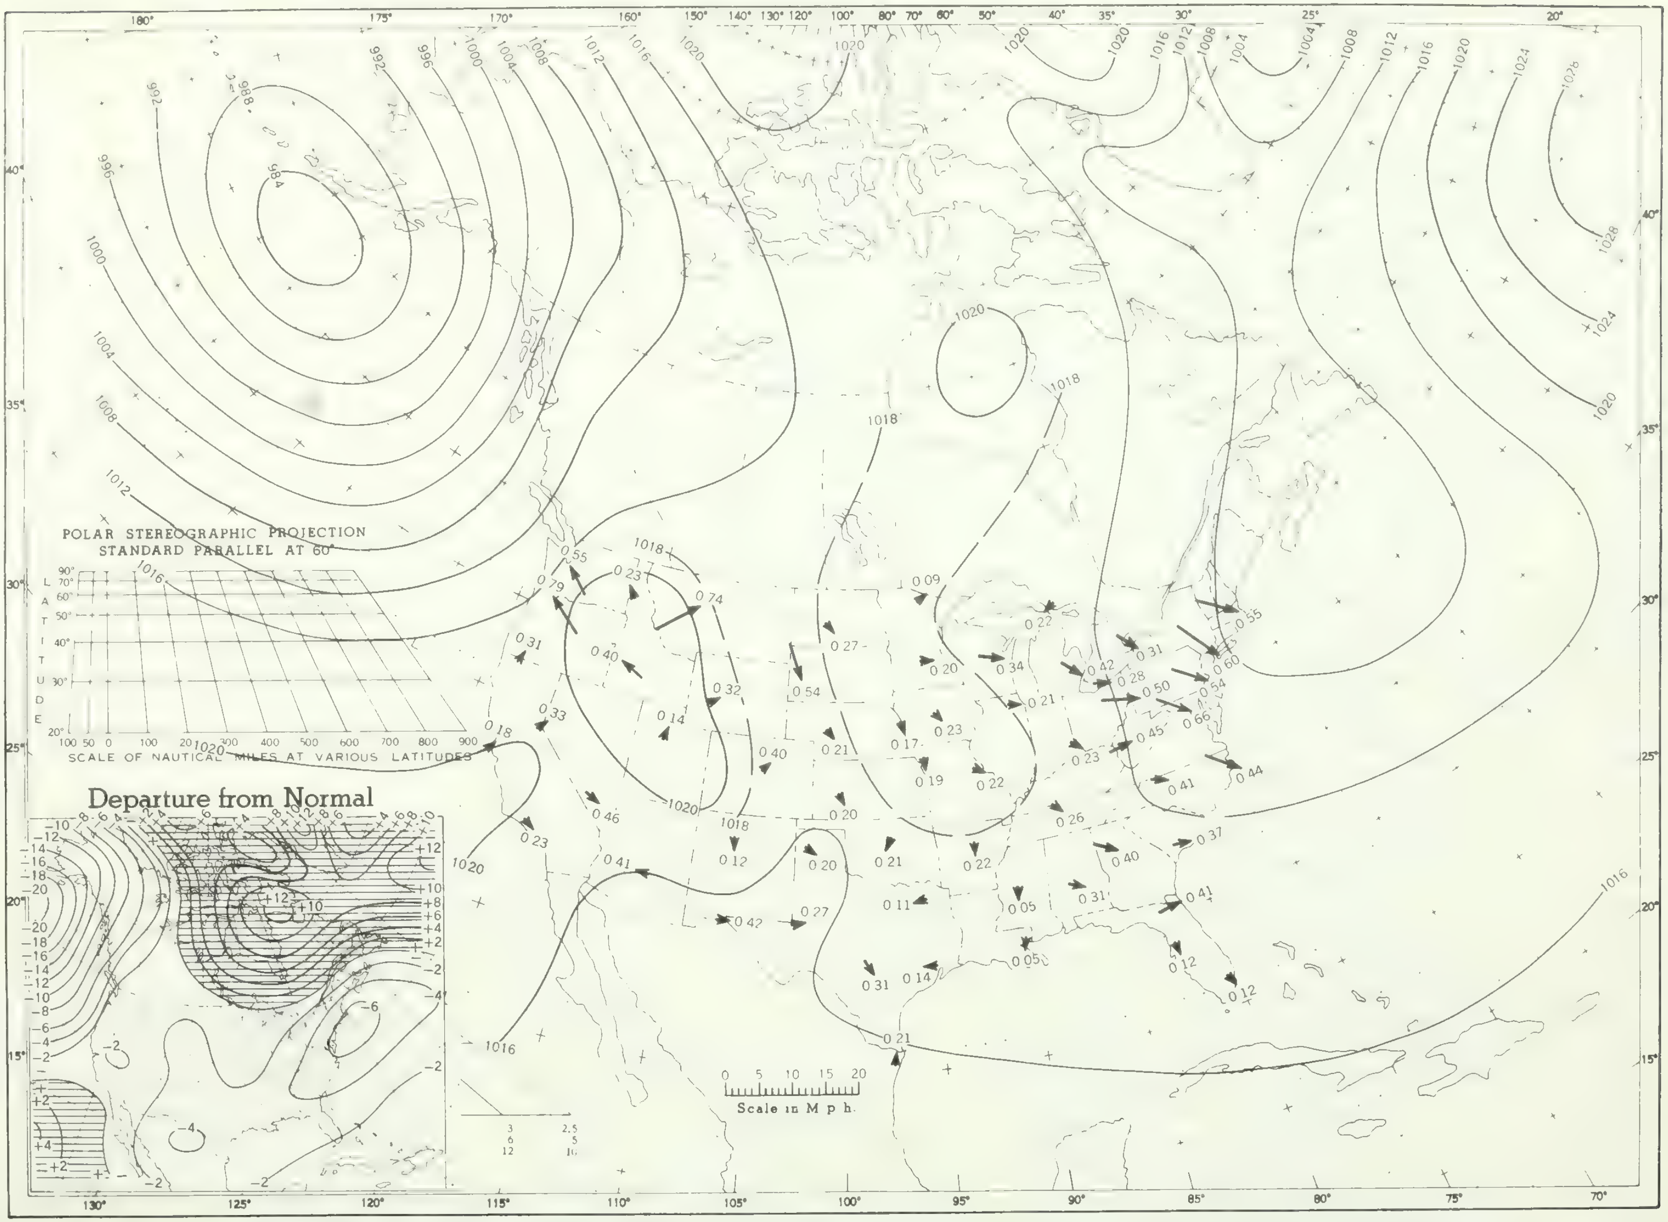
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, December 1969.



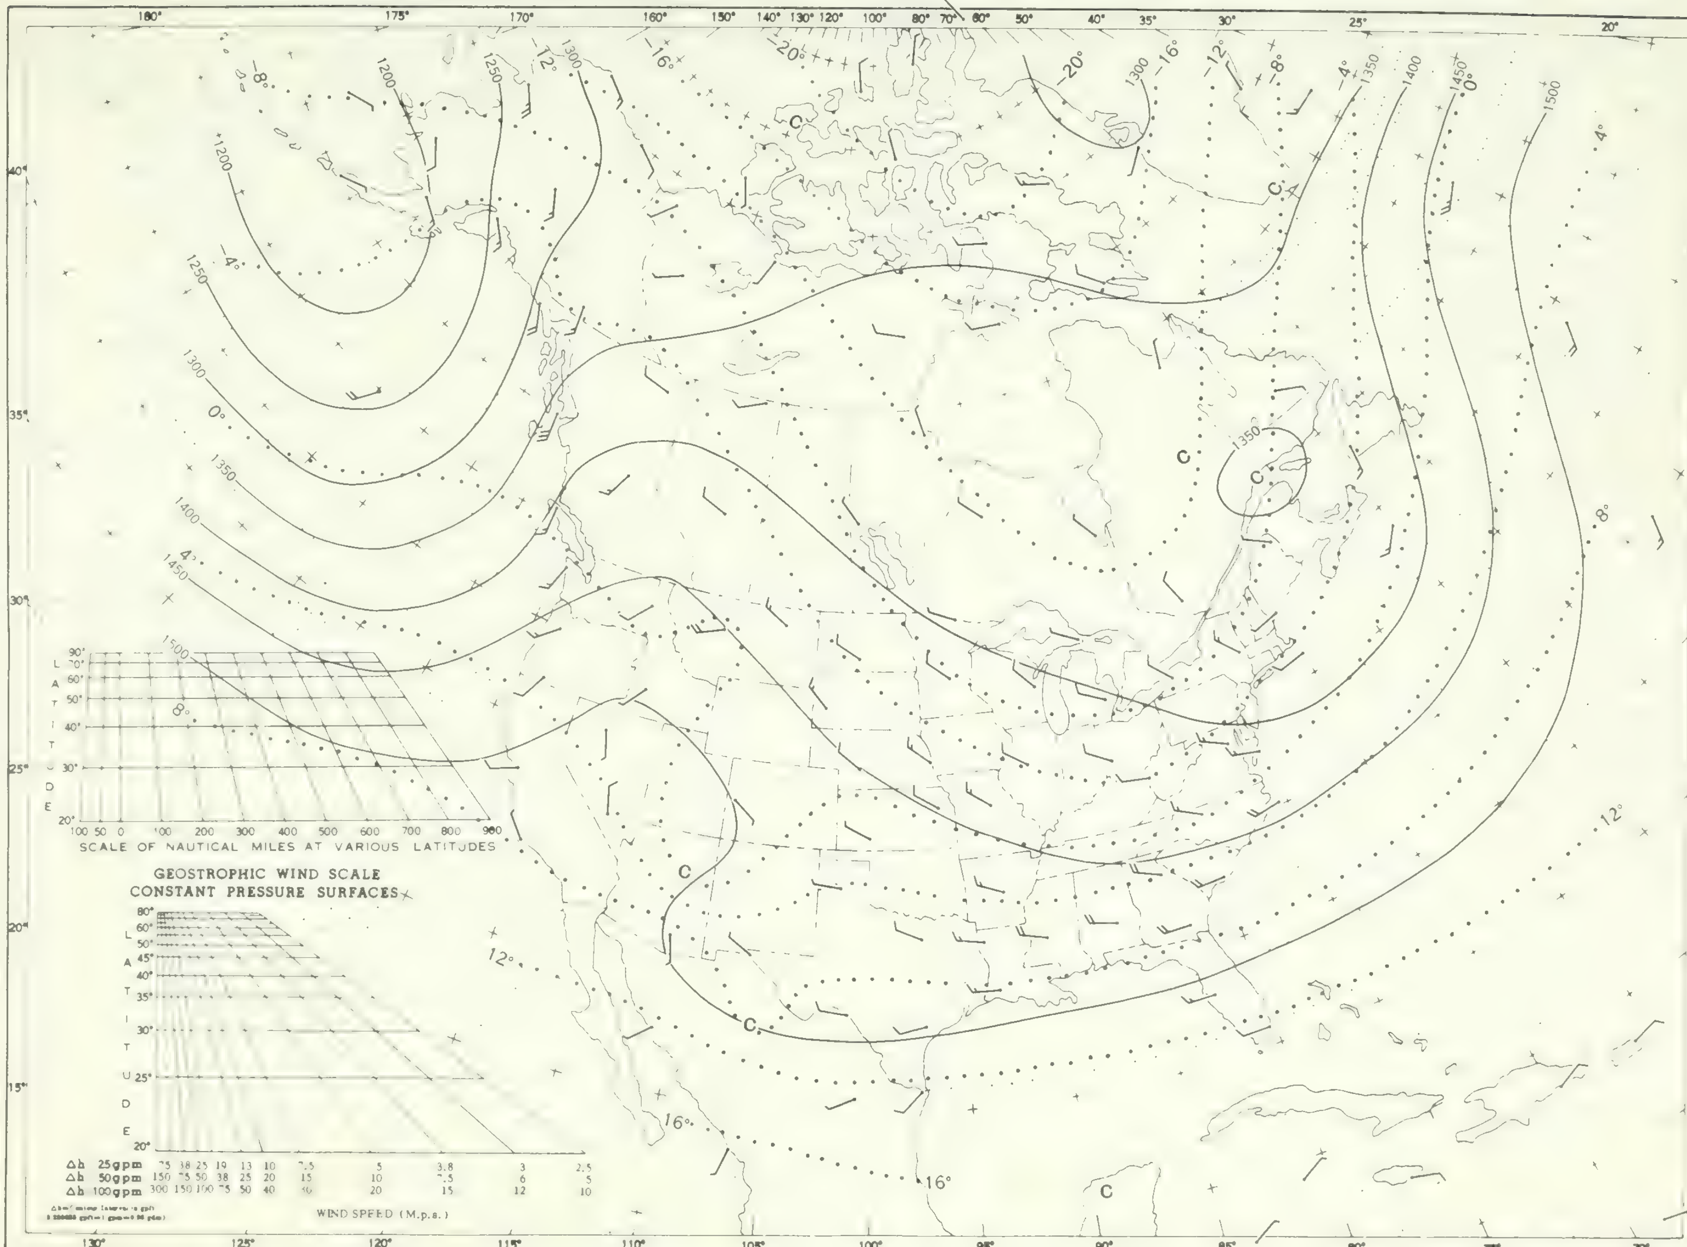
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, December 1969. Inset: Departure of Average Pressure (mb) from Normal, December 1969.



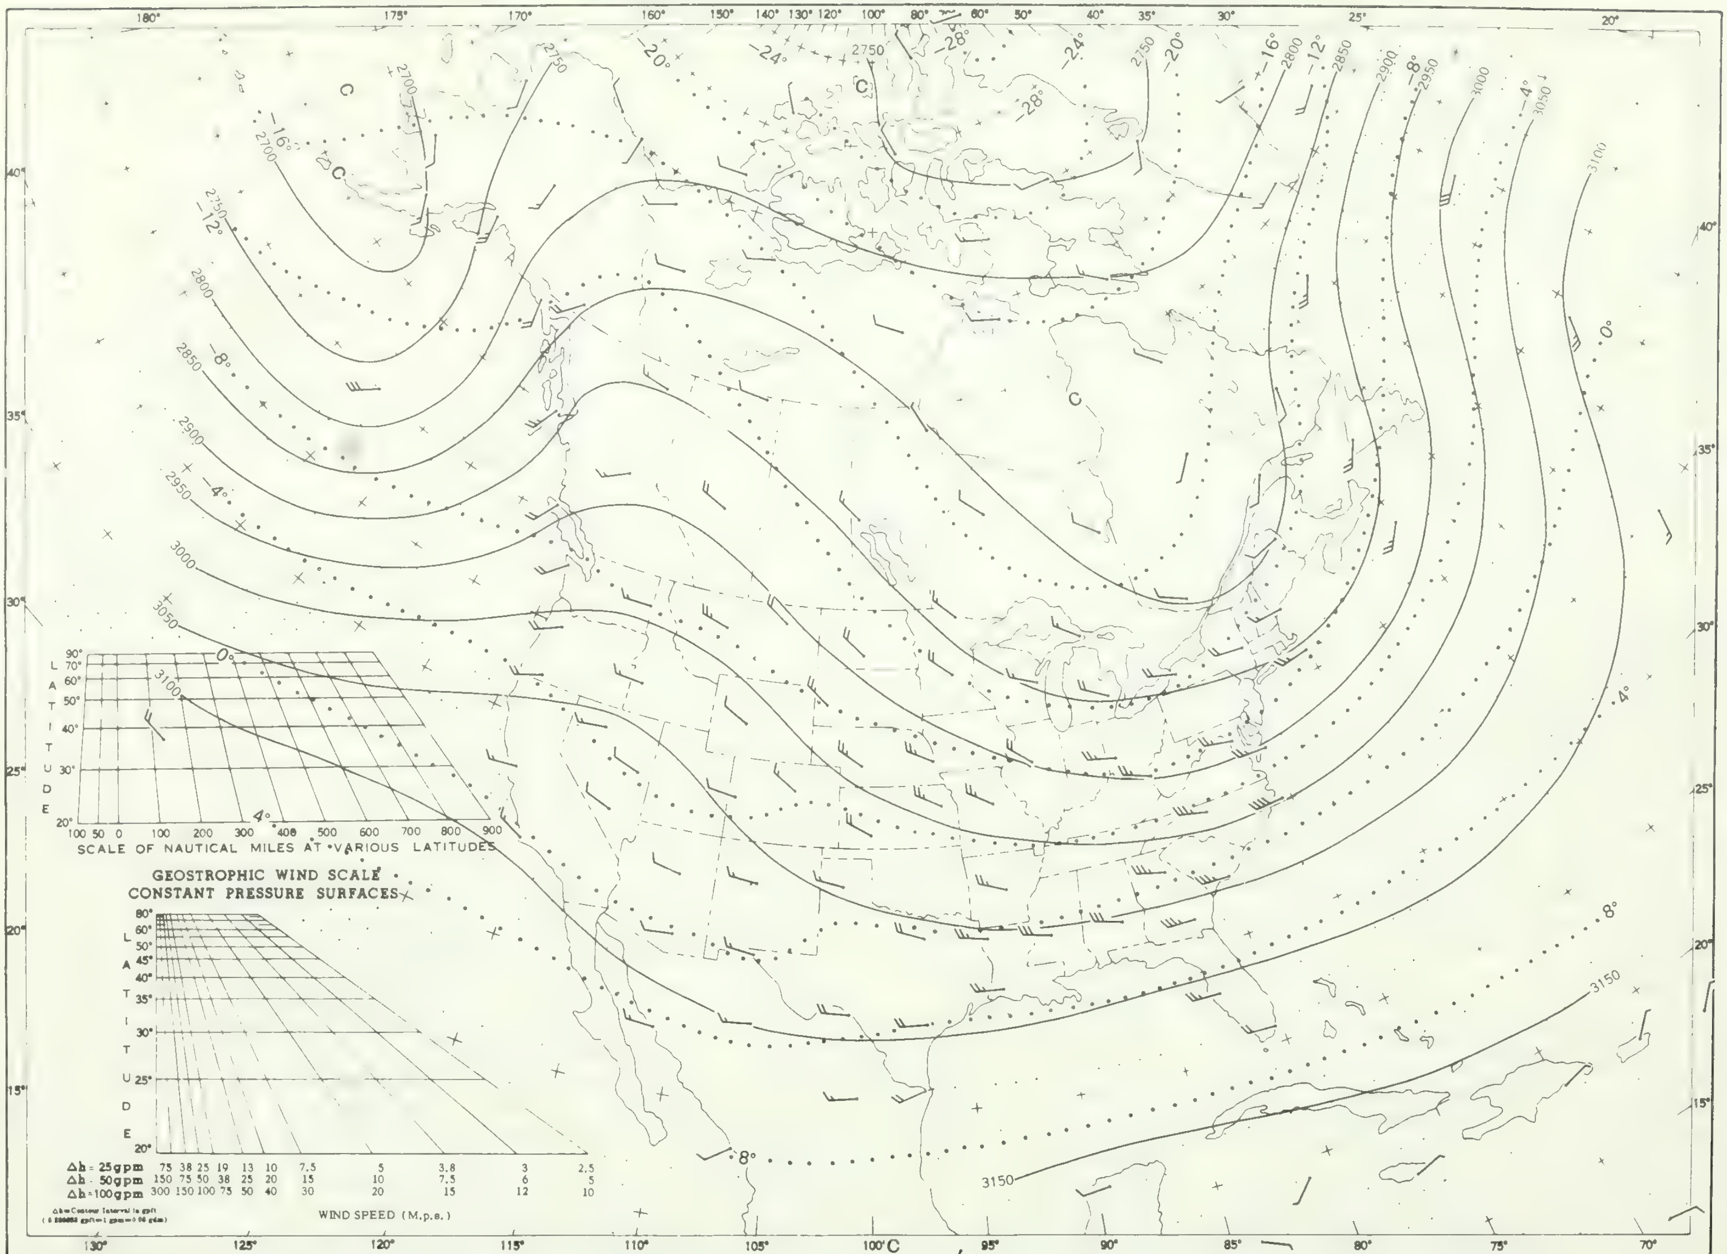
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XI 850-mb Surface, 1200 GMT, **December 1969**. Average Height and Temperature, and Resultant Winds.



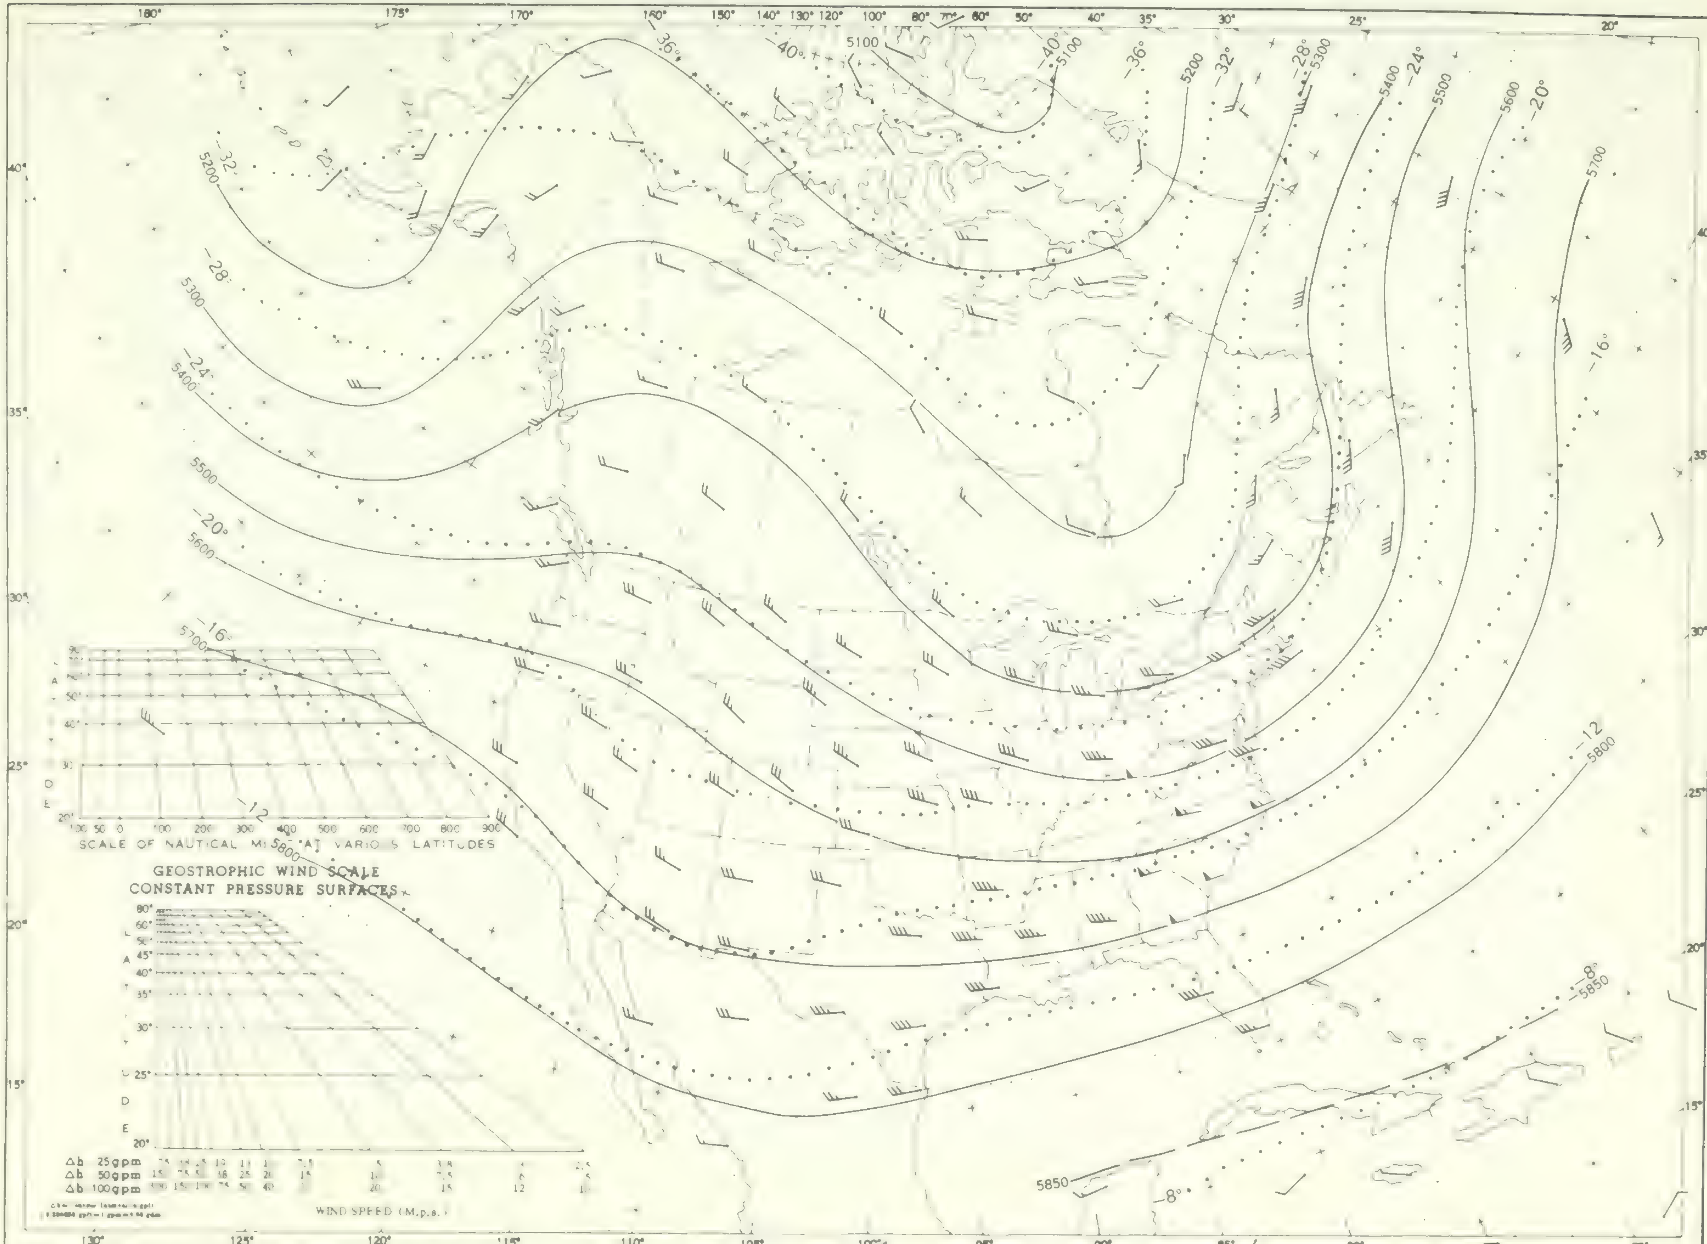
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 GMT, **December 1969.** Average Height and Temperature, and Resultant Winds



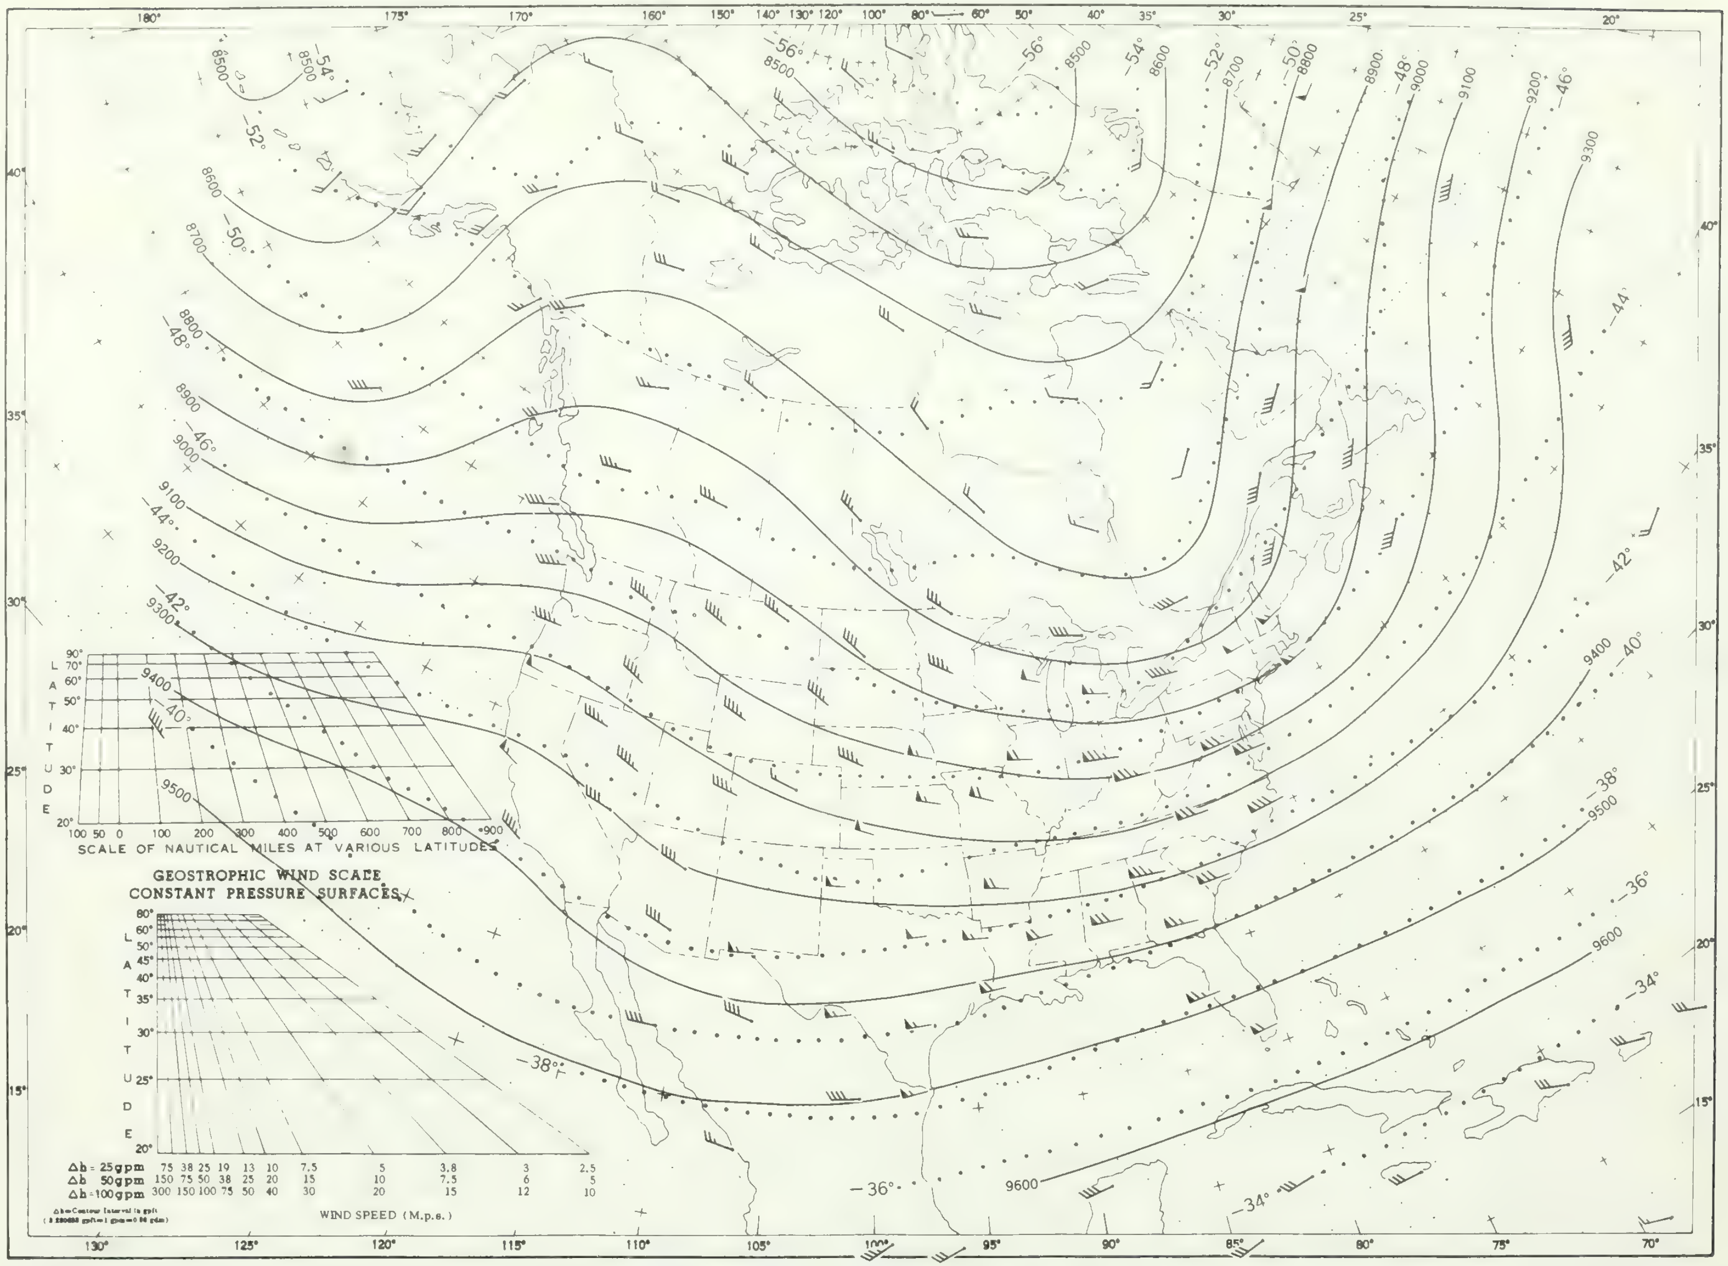
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25mps, full feather 5mps, and half feather 2.5mps. All wind data are based on rawin observations.

Chart XIII 500-mb. Surface, 1200 GMT, **December 1969**. Average Height and Temperature, and Resultant Winds.



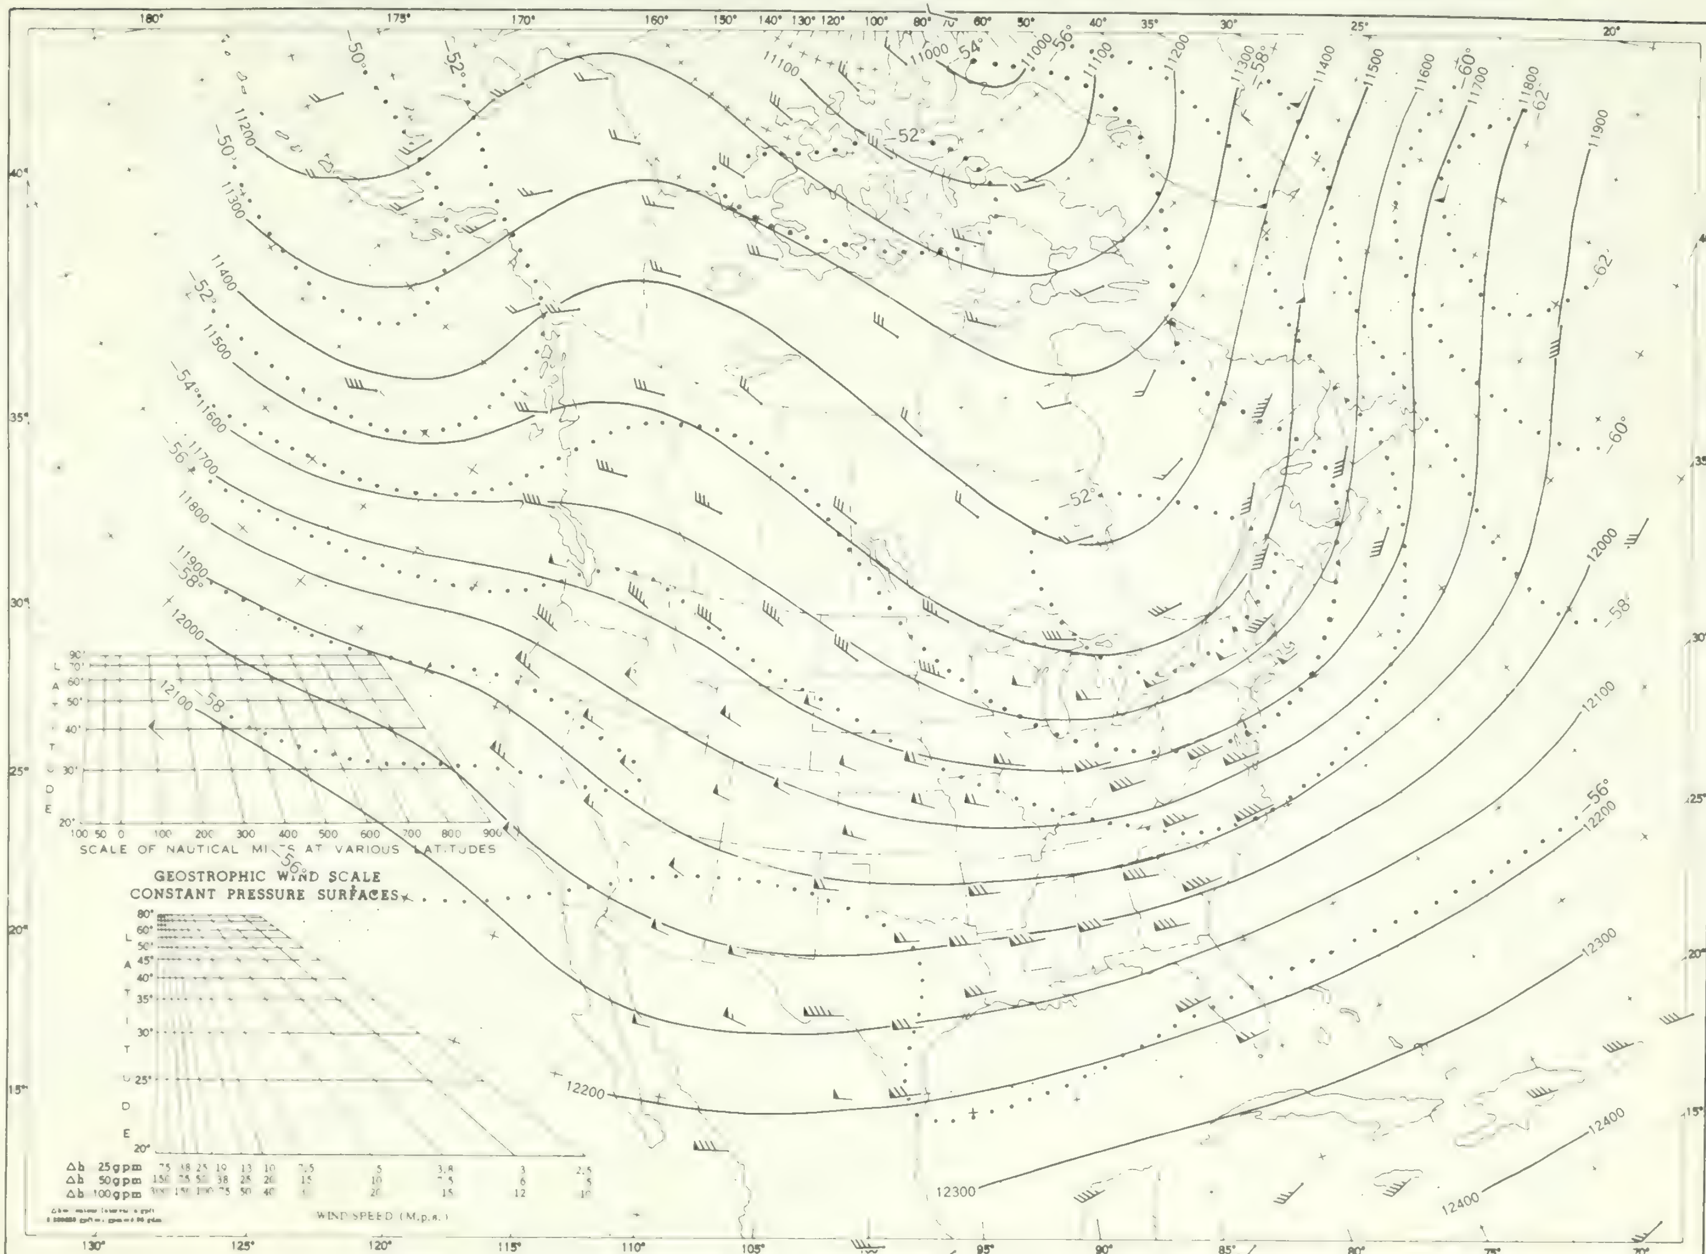
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV. 300-mb. Surface, 1200 GMT, **December 1969**. Average Height and Temperature, and Resultant Winds.



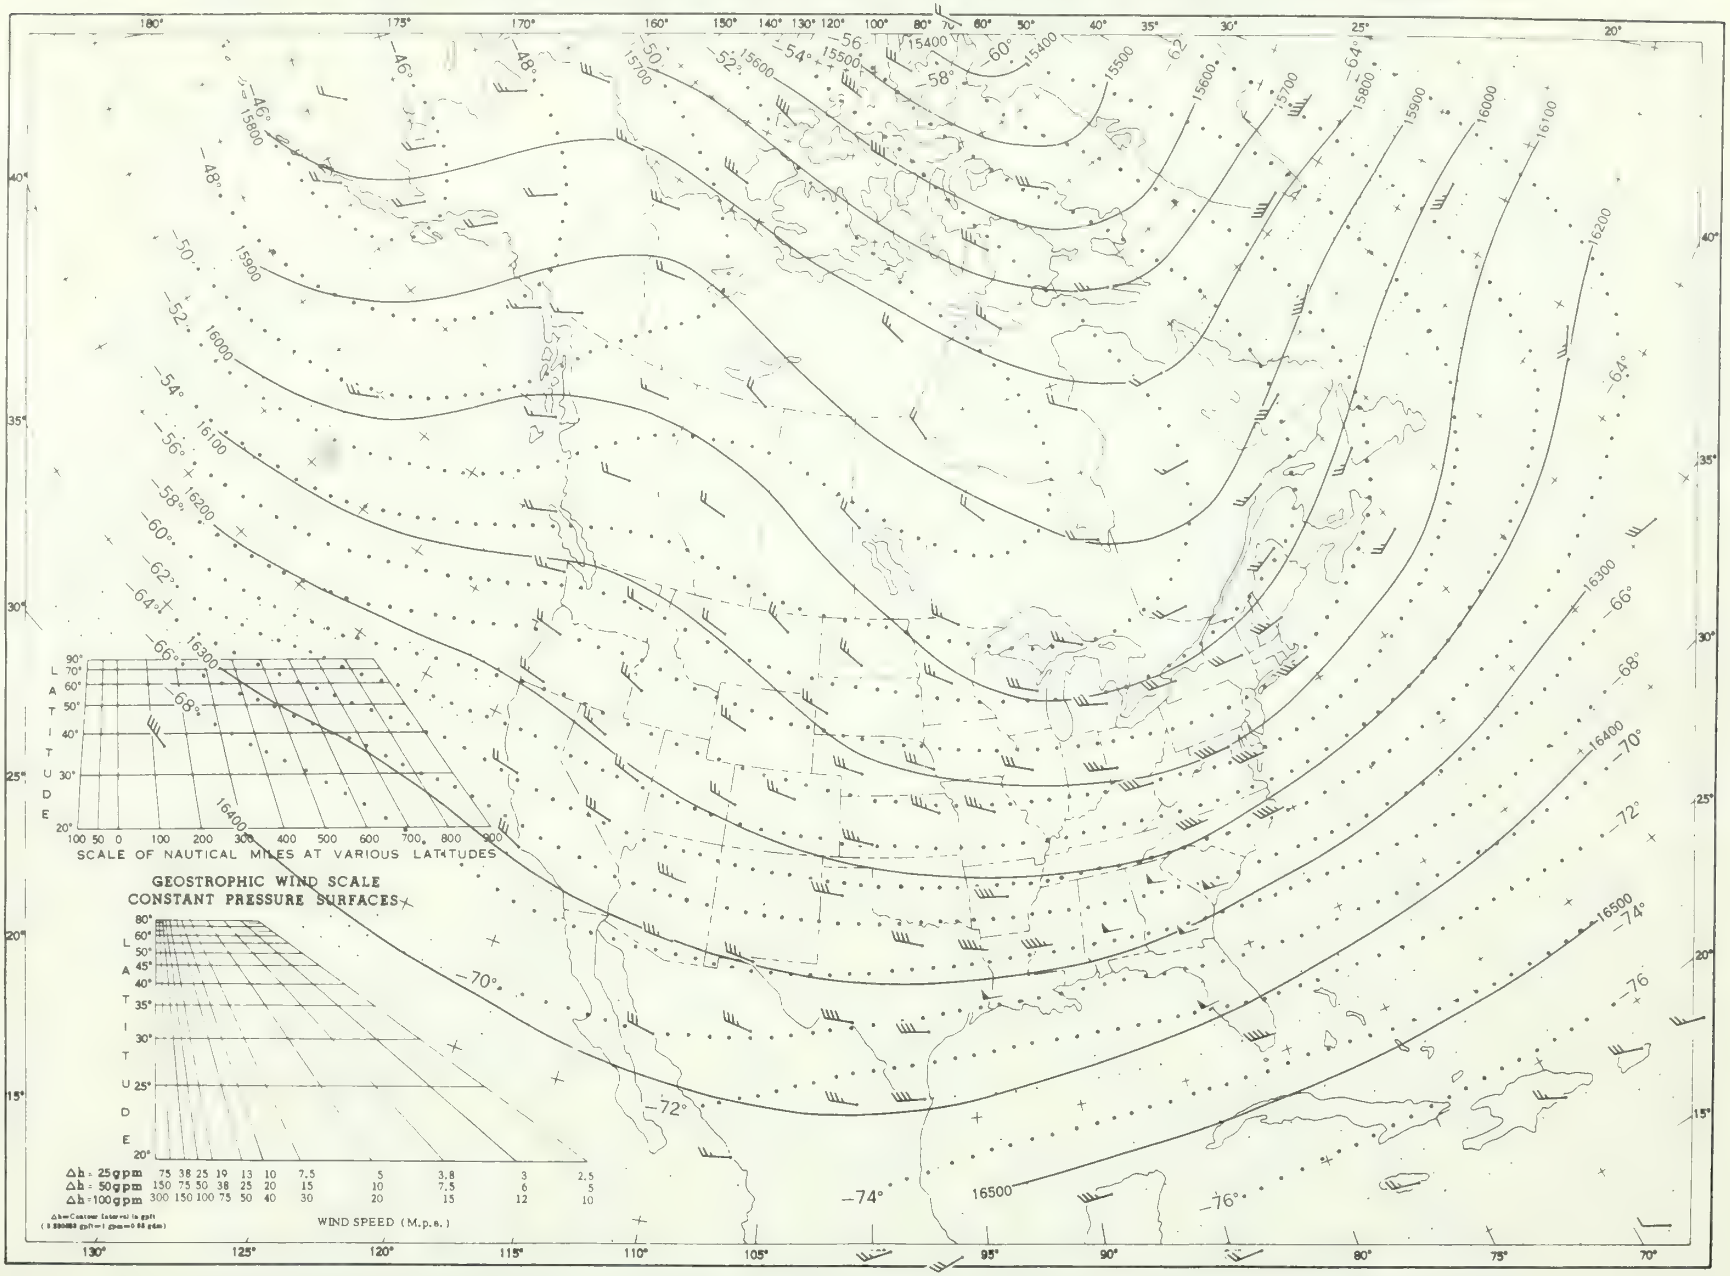
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV. 200-mb. Surface, 1200 GMT, December 1969. Average Height and Temperature, and Resultant Winds.



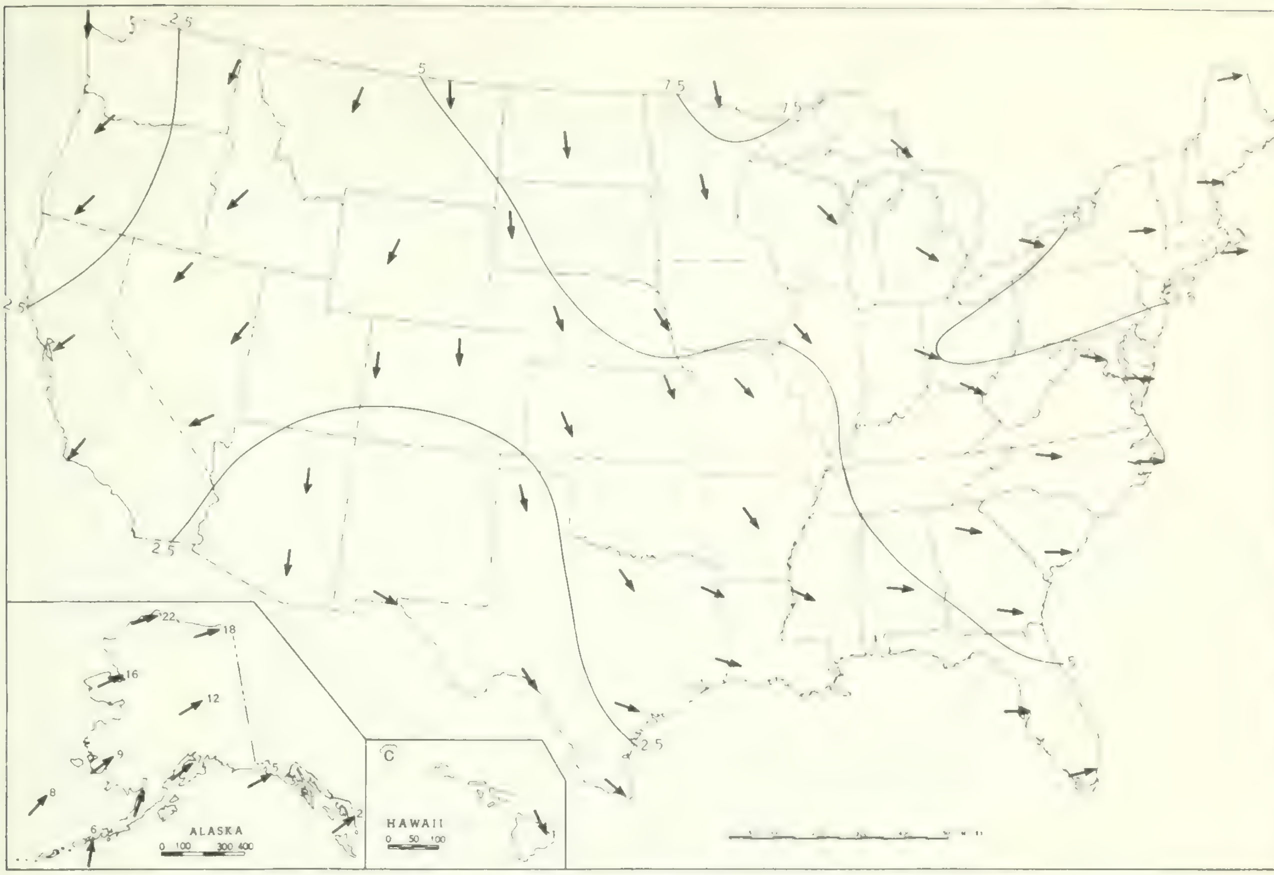
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25mps, full feather 5mps, and half feather 2.5mps. All wind data are based on rawin observations.

Chart XVI. 100-mb. Surface, 1200 GMT, December 1969. Average Height and Temperature, and Resultant Winds.

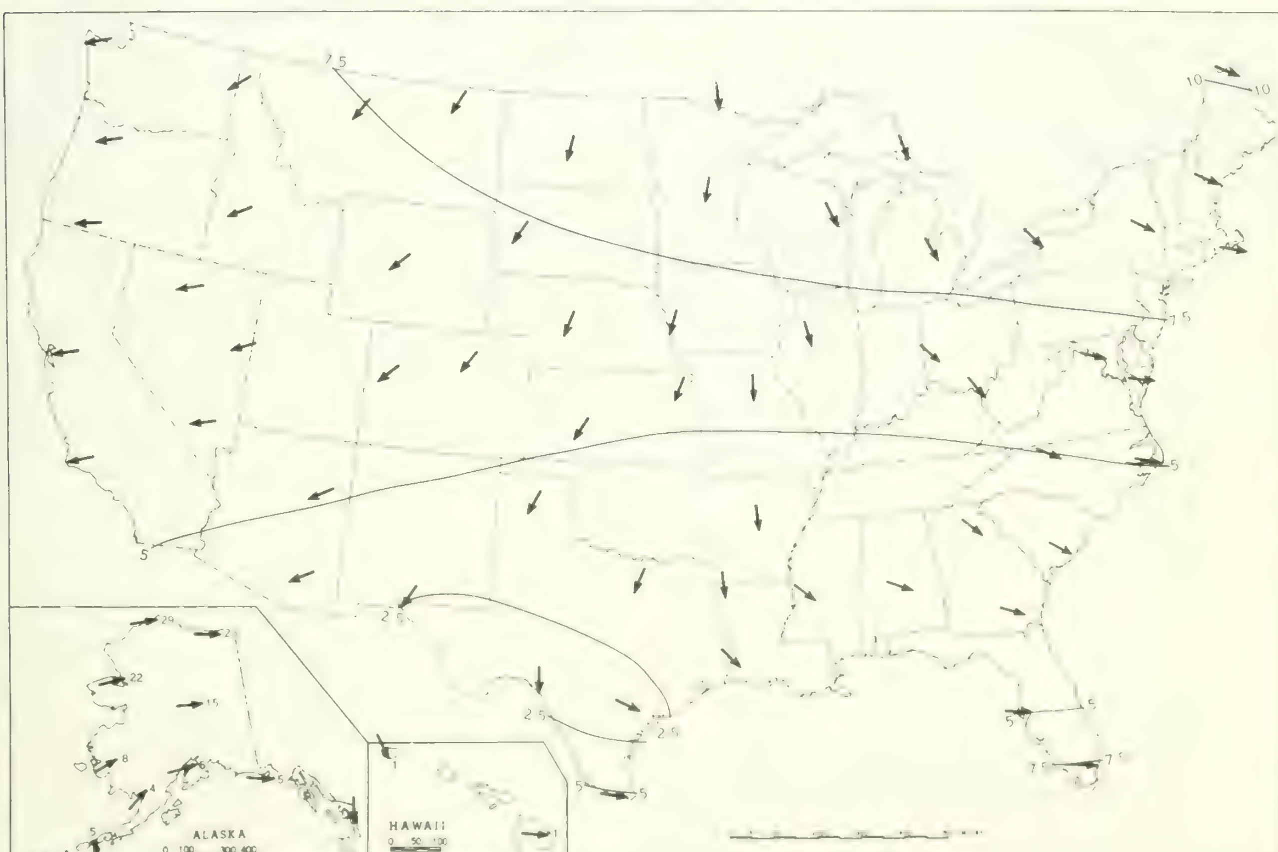


Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 GMT, December 1969. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, December 1969. Resultant Winds.



Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 20 No. 13 Year 1969

GENERAL SUMMARY OF WEATHER CONDITIONS

L. H. Seamon
Environmental Data Service, ESSA
Washington, D. C.

HIGHLIGHTS:

1. Heavy to recordbreaking snowfall in North and Far West.
2. California storms in January and February.
3. February among snowiest months in New England history.
4. A cold March and October, warm April.
5. Camille, record damaging hurricane, August 17-20.
6. April floods in upper Midwest.
7. Numerous severe local storms in midcontinent area.
8. Coldest year some southeastern points.
9. Favorable weather for most major crops.
10. Northern Ohio's worst flash floods, July 22.

Weather conditions favored production of most crops. Warm season rainfall generally was sufficient in the Corn Belt, although May rains delayed corn planting in some sections. Irrigation water supplies were good to excellent in most of the Far West. Spring freeze damage was limited mostly to tung crop damage in Mississippi. Severe thunderstorms with damaging hail, wind, and heavy downpours were numerous, particularly in the midcontinent area, during the spring and summer and took a heavy toll of crops and property. Snowfall was unusually heavy in many northern and far western areas, with a number of recordbreaking snowstorms in the Northeast causing millions of dollars damage. Hurricane Camille was one of the most damaging storms in history. Below-normal temperatures were so persistent in the Southeast that several locations reported their lowest annual temperature on record.

TEMPERATURE.--WINTER The December 1968-February 1969 winter was unusually cold in Montana and abnormally cold elsewhere except slightly warmer than normal in Texas, southern portions of the western Great Plains immediately east of the Rocky Mountains, and in the central Great Basin. Hinsdale, Mont., recorded -55°F. on January 25, the lowest temperature during 1969 in the 48 Contiguous States, and Chalkyitsik, Alaska, recorded -69°F. on January 8-9, the lowest during 1969 in the United States. Severe cold persisted nearly all winter in Montana, and some locations in the State had their coldest winter on record. This was also the coldest January on record in southeastern Alaska.

SPRING March was abnormally cold in the 48 Contiguous States, the coldest in more than 50 years in many southern areas. At Concord, N. H., -15°F. on March 6 was the lowest there of the cold season, the first time the lowest temperature occurred in that area in March since 1884. A freeze in Mississippi on March 11 with a low of 27° at Poplarville caused moderate to severe damage to the tung crop.

April was abnormally warm in the 48 Contiguous States, except relatively cool in the Pacific States. This was the warmest April in 23 years at Cheyenne, Wyo., and the first April in 23 years without a temperature as low as 32°F. at Indianapolis, Ind.

May temperatures were milder than usual, except slightly cooler than normal in the Gulf States and from the Great Lakes region through New England. Abnormally mild temperatures persisted all month west of the Continental Divide, but alternating warm and cool periods were the rule east of the Rocky Mountains. The Nation's Capital recorded 97°F. on the 29th, equaling the highest temperature there for May in the past 100 years.

SUMMER During the June-August period, temperatures averaged below normal in the central Great Plains and from the northern Rocky Mountains to the Great Lakes and slightly above normal in most other areas. June, relative to normal, was warm in coastal areas and cool in the interior. A number of stations in Wisconsin reported their coldest June on record. A freeze in extreme north-central areas just before midmonth caused some damage and slowed growth of crops.

July was abnormally cool in the northern half of the 48 Contiguous States and hot in the South. Concord, N. H., had its coolest July, while Greensboro, N. C., Waco, Tex., and Pueblo, Colo., had their hottest July. The weather was persistently hot and humid in the southern Great Plains, and daily maxima frequently rose to 100°F. or higher during the first half of the month.

August, relative to normal, was cool in the southeastern quarter of the Country and warm elsewhere. In the Southeastern States rain and clouds were an important factor in keeping temperatures below normal the first 3 weeks, and the advection of cool air masses helped maintain below-normal temperatures the rest of the month. Unusually hot weather persisted in the southwest deserts where highs ranged from 110°F. to over 120°F. on a few days, and in Texas where highs ranged from 90°F. to over 100°F. the first 3 weeks of the month.

AUTUMN Temperatures for the September-November period averaged below normal, except slightly above in a few small scattered areas. In September above-normal temperatures persisted in the western half of the Country except for a cool spell during the third week, while relatively cool weather persisted in the eastern half after the first week. This was the warmest September on record at Lander, Wyo., Bakersfield, Calif., and in 17 years at Salt Lake City, Utah.

October was unusually cold in the Upper Rocky Mountains and colder than normal elsewhere in the 48 Contiguous States, except slightly above along the California, Gulf, and south Atlantic coasts. A number of stations including Cheyenne, Wyo., Goodland, Kans., Grand Junction, Colo., and Fresno, Calif., had their coldest October of record and many others had their coldest October in 20 to 50 years. The month was abnormally warm in Alaska, with a recordbreaking high of 65° for Fairbanks on the 13th.

November was warmer than normal in New York, New England, and in most of the area from the Great Plains westward, and over 6° above normal in north-central Montana. The month was colder than usual from the middle Great Lakes region southward and southeastward to the Gulf and Atlantic coasts. Some stations in the Mississippi Valley had their coldest November since 1959.

DECEMBER Temperatures averaged near to above normal over the western portion of the Country and

below normal over the eastern portion, being generally 2° to 3° warmer than usual over the Rocky Mountain region and Southwest and 3° to 6° below normal over the Southeast where cold weather persisted most of the month. In the Northeast many stations reported the coldest Christmas of record, such as -22° at Albany, N. Y.

PRECIPITATION.--WINTER Precipitation during the December 1968-February 1969 winter was much above normal in New England, north-central interior regions, and the Rocky Mountain and Pacific States, and slightly below normal elsewhere.

Much of the above-normal precipitation was in the form of snow. Near record to record amounts in the Far West almost assured a good warm season water supply, a very important factor in the economy of the Far West. Heavy winter snowfall in the central and northern Great Plains and Upper Mississippi Valley resulted in severe spring flooding. Snowfall in New England, particularly in February, was notable for some of the worst snowstorms in the history of that area.

SPRING Above normal precipitation during the March-May period was limited mainly to the Gulf and south Atlantic coastal areas, the lower Great Plains, and parts of Michigan, Iowa, Missouri, New Mexico, Arizona, and Washington. Elsewhere the spring amounts were below normal, although only a few small scattered areas had less than 50% of normal. The most important deficiency was in an area reaching from Pennsylvania and Maryland southwestward into parts of West Virginia, Ohio, Kentucky, and Tennessee. At the end of May, however, moisture conditions were mostly satisfactory. Owing to the unusually low temperatures of March, considerable snowfall was recorded in some areas. Snowfall increased the snowpack in the mountains of Colorado and New Mexico, areas that were not favored with the near-record snowfalls in most other sections of the Far West during the winter months.

SUMMER The June-August rainfall was adequate in most areas, with above-normal amounts in most of the East, the Midwestern Corn Belt, and much of the Rocky Mountain and Great Basin areas. Amounts ranged from 4 inches in the western Great Plains to over 8 inches in the eastern Great Plains, from 12 to 16 inches in the Corn Belt, and from 8 to over 24 inches in the East. The main dry area extended from Alabama through eastern Texas where some sections received less than 50% of normal rainfall, with some crop deterioration in Texas.

AUTUMN The September-November period was drier than usual in most areas, and mostly favorable for harvesting operations. Above-normal rainfall was limited mainly to the lower portions of the Rocky Mountains and Great Plains, New England, and Florida. Most areas had light rainfall in September, but the mid-continent area was unusually wet in October which caused some delay of harvesting operations. November was unusually dry in most of the midcontinent area.

DECEMBER In the West frequent storms from the Pacific, often accompanied by strong winds, brought above normal precipitation to northern areas west of the Rockies, with heavy snowfall in the mountains. Precipitation was also heavy in the Dakotas and Upper Mississippi Valley, and from New Mexico and the Gulf States to New England, with heavy snowfall in the Appalachians. Amounts generally were below normal elsewhere, and were less than one-half the usual amounts in the southwest desert and the western edge of the central Great Plains.

In a number of areas -- parts of the Northeast, southern Florida, and Upper Mississippi Valley -- this was one of the wettest Decembers on record. New record amounts for December were measured at Portland, Maine, 9.69 inches; Boston, Mass., 9.74 inches (a 152-year record); Wilmington, Del., 7.90 inches; and St. Cloud, Minn., 2.04 inches.

SNOWFALL.--Outstanding snowfalls occurred in three areas during January and February 1969 -- the Far West, the Upper Mississippi Valley, and the Northeast. In the Far West 1969 was a year of the "Big Snow." During January and February storms deposited an abnormally heavy snow mantle on an already above average snowpack built up during the closing months of 1968. Snowfall for the three winter months left one of the heaviest snowpacks on record in the Cascade and Sierra Nevada Mountains, and in parts of Nevada, Utah, and Idaho. The cover was extremely heavy even at lower elevations, owing to abnormally cold weather which prevented melting and also resulted in heavy snowfall in many areas where rain is the usual form of precipitation. By the end of February many mountain snow areas in California, the Columbia Basin, and in the Great Basin exceeded the average April 1 accumulation which is the usual time of maximum depth. Helena, Mont., had a record snowfall for January of 35.6 inches. In February Mt. Shasta, Calif., had 83.7 inches of snowfall, its second greatest in an 80-year record and Salt Lake City, Utah measured 27.9 inches, the greatest in 40 years.

During the spring months in the Far West snowfall generally was below normal, although there were above normal falls in the southern Rockies in March and parts of the Colorado Rockies in May. During April warm weather caused considerable melting of low and intermediate elevation snow covers, removing the snow form lower levels. Timely cool spells generally prevented serious flooding. The main exception was California's Tulare Lake Basin where thousands of acres of agricultural land were flooded. The heavy seasonal snowfall, however, was the basis for a good to excellent outlook for warm season water supplies.

In the North Central Interior a heavy snow mantle of 1 to nearly 3 feet covered northeastern Nebraska, eastern South Dakota, Minnesota, most of Wisconsin, and northern Michigan at the end of December 1968. From 1- up to 4-foot falls in this region during January, and up to 2 feet in the upper Great Plains, southwestern Minnesota, and western Iowa during February combined with rather persistent cold weather maintained a heavy cover even though February falls in much of the Upper Mississippi Valley and Michigan were less than 50 percent of normal. At the end of March, a month of below normal snowfall, Sioux Falls, S. Dak., reported a seasonal fall of 94.7 inches, a new record, and Grand Island, Nebr., reported 54.4 inches, the second highest in 20 years.

Frequent snowstorms and cold weather which accounted for the persistent heavy snow cover from the Upper Great Plains to the western and central Great Lakes region closed many roads for long periods, hampered business activities, imposed a hardship on farm families, forced many schools to close, and required millions of dollars for snow removal. The greatest damage, however, in many areas was caused by flooding when the snow melted in April.

The Northeast, especially New England, had more than the usual number of heavy snowfalls during the winter. February 1969 was one of the snowiest months in New England's history. Many stations recorded new record amounts, not only for February but for any month. For example, the 1968-69 season total at Mt. Washington,

N. H., by the end of February was 440.4 inches far exceeding the previous record for an entire season of 344.1 inches in 1957-58.

December snowfall was generally below normal west of the Great Plains, although above in parts of California, Utah, Colorado, and in northern New Mexico. From the middle and upper Mississippi Basin eastward, however, snowfall was unusually heavy, setting new records for December in Minnesota and the Northeast. A number of stations reported record snowfall. Stations measuring December record snowfall included Harrisburg, Pa., 28.3 inches; and Minneapolis, Minn., 33.2 inches. This was the snowiest month on record at a number of stations among which were Albany, N. Y., 57.5 inches, and Burlington, Vt., 50.8 inches. In Vermont 75.0 inches at Waitsfield and 78.5 inches on Mt. Mansfield both broke the old state record for any month.

SEVERE STORMS.--WINTER-TYPE STORMS Several major snowstorms swept over the Northeast during the winter of 1968-69, and two storms in February 1969 were particularly outstanding. The first of these two moved up the coast from Virginia on the 9th and 10th. Falls generally ranged from 1 to 2 feet in Massachusetts and northern New England, up to 25 inches in Connecticut, and from 6 to 21 inches in Rhode Island. In extreme southeastern New York and northern New Jersey, falls generally ranged from 12 to 18 inches but as much as 25 inches locally. New York City measured 15 inches, the greatest fall there in 8 years. At Pinkham Notch, N. H., 30 inches of snow fell in 24 hours, increasing the depth on the ground to 100 inches. Greenville, Maine, had 63 inches on the ground, the deepest since 1935. Throughout the area of heaviest snowfall, high winds gusted to 70 m.p.h. locally. Huge drifts (up to 9 feet in Maine) halted air and surface transportation. Many utility outages were reported and a number of roofs and buildings were crushed under the weight of the snow. This was the heaviest and most devastating snowstorm in years in Massachusetts. Damage in New England exceeded $5 million. New York City and Nassau County, N. Y., were nearly paralyzed on the 10th and 11th, and the estimated cost of snow removal in New York City exceeded $4 million.

The second snowstorm, far exceeding the record-breaker of the 9th and 10th in some areas, struck New England February 23-28. In this storm 2 to 4 feet of snow fell in much of southern and central Maine, northeastern Vermont, most of New Hampshire, eastern Massachusetts, and northern Rhode Island, and even heavier amounts were reported in the White Mountains. In parts of Massachusetts this was the heaviest snowstorm in 100 years. In Allston, Mass., the snow load on one fallen roof measured 102 pounds per square foot. Some sections of northern Rhode Island received up to 52 inches of snow from the two coastal storms and were virtually buried in large drifts. In New Hampshire, Mt. Washington Summit measured a new storm total of 97.8 inches, many buildings collapsed under the weight of the snow, and even ski resorts were closed by too much snow. In Maine 57 inches at West Forks was a new official state storm record. The snow depth at Rumford, Maine, was 6 feet. Estimates of losses in New England were at least $60 million.

A storm in the Carolinas on February 15-17 deposited up to 24 inches of snow in the mountains and heavy glaze in northeastern and north-central South Carolina and south-central North Carolina. This ice storm caused great forest damage and heavy utility losses. Many towers carrying high voltage wires were downed. Total damage was estimated at about $65 million.

Unusually heavy snow fell in Oregon's Columbia Basin and western counties on January 25-30. Falls of 2 to 3 feet at lower elevations in coastal areas from Coos County northward and heavier amounts at higher elevations broke all previous records. In Eugene the depth was 34 inches on the 30th. More than 200 farm buildings and 10 to 15 large industrial buildings collapsed under the weight of snow. Thousands of sheep perished, and thousands of telephone and power customers were without service for periods up to several days. Many roads and highways were closed by deep drifts. Three counties and parts of several others were declared disaster areas. Damage amounted to hundreds of thousands of dollars.

One of the worst spring snowstorms in many years occurred in southeastern Montana and northeastern Wyoming on April 25-27. Gale-force winds and snowfall ranging up to 2 feet or more damaged utility lines and forests. Tens of thousands of livestock were lost. Total losses were estimated at $5.5 million dollars in Wyoming and more than $1 million in Montana.

Snowfall was unusually heavy during October in northern New England, Idaho, and Colorado. In Colorado this was the coldest October, with major snowstorms on October 3 to 5 and 29 in the northeastern sections and on the 11-12th over most of the State. Snowfall during the first storm ranged up to 16 inches at Denver and 3 feet in the mountains. After the second storm, snowfall set new records for October in many areas.

Damage to crops, trees, and utility lines in Colorado totaled many thousands of dollars.

HAIL.--Hail losses during 1969 were unusually heavy. The Iowa Monthly Weather Summary for September gave the total hail losses in that State for the 1969 growing season as $25,350,000, a new record. A few of the most damaging hailstorms in the Nation are listed below.

On April 18 hail fell in Warren County, Ky., including about three quarters of the city of Bowling Green. Hailstones averaged about one inch in diameter but ranged up to 3 inches or larger in diameter. Insured damage to stationary objects, such as buildings, totaled about $2.1 million, according to preliminary estimates. In addition, many vehicles (perhaps as many as 15,000) were damaged, the amount ranging from $100 to $15,000 per car.

In parts of five southeastern Kansas Counties on May 21 hail with largest stones about 3 inches in diameter damaged property to the extent of $2.8 million at Hutchinson, $1.5 million at El Dorado, and $500,000 at Derby.

Many very severe hailstorms occurred in Texas during June. One of these hailstorms with high winds caused $3.2 million damage in Plainview and Hale County on the 10th. Another hailstorm, with stones up to 4 1/2 inches in diameter and some stones described as the size and shape of a brick, accompanied by winds of 50 to 60 m.p.h., caused estimated losses of $3 million in Winters and Runnels Counties on June 12. On the 13th several storms occurred, one of which struck parts of Baily, Hall, and Lamb Counties resulting in $3.6 million damage. But the most damaging hailstorm of the month struck Amarillo and vicinity on the 17th, causing $15 million property damage in the city and $1 million crop losses in the vicinity. This rates among the most damaging hailstorms on record.

TORNADOES.--During 1969 the total number of tornadoes was 607, the 1953-69 average is 642. Deaths

totaled only 66, much lower than the 17-yr. average of 119. Damage was also much less than usual.

The tornado season, as usual, began in the South. The first major tornado there on January 23 left a path of destruction from Jefferson to Newton Counties, Miss., killing 32 persons and injuring 241. Damage may have exceeded $2 million.

Tornadoes in southern portions of Alabama and Georgia on April 18 killed 2 persons, injured 45, and caused property losses of at least $2.5 million.

On May 8-10 tornadoes in western Ohio killed one person, injured 75 persons, and caused property losses estimated at more than $3 million.

In southern Missouri on June 22 tornadoes killed 6 persons, injured 42, and damaged or destroyed many buildings.

A tornado in Washtenaw and Wayne Counties, Mich., on July 4 injured 50 persons and caused property losses estimated at $2 million.

On August 9 a tornado in the Cincinnati area of Hamilton and Clermont Counties, Ohio, killed 4 persons and injured 247. Total storm damage was estimated at $10 to $12 million in Hamilton County and $200,000 in Clermont County.

On June 21 a tornado in Saline County, Kans., severely damaged or completely destroyed 104 homes, slightly damaged 571 others, and destroyed 7 business structures. Sixty persons were injured and total damage was estimated at $10 million.

HURRICANES.--Highlighting the storm weather scene for 1969, hurricane Camille took a high toll of human lives and set a new high for value of property destroyed. Camille on August 17 struck the Mississippi coast with winds estimated up to 200 m.p.h. and tides up to 24 feet. With intensity decreasing to that of a tropical storm as she moved northward over Mississippi, Camille swung eastward across Kentucky and Tennessee, the Virginias and southern Maryland. Recordbreaking rainfall and floods in southwestern Virginia caused further devastation. Deaths in the Gulf coastal area and southwestern Virginia totaled 256 and 68 persons were missing. Total damage was estimated at $1.42 billion, slightly exceeding the record amount set by Hurricane Betsy in 1965. Of the 10 hurricanes occurring in the north Atlantic during 1969, Camille was the only one that had a major effect on the United States.

OTHER STORMS.--One of the most destructive storms of the year produced heavy rain and snow in California on January 18-28. Heavy rains caused flooding and mudslides. Many homes and several sewage disposal plants were damaged or destroyed, bridges and parts of highways and railroads were washed out, utilities disrupted, and thousands of persons evacuated from their homes. The storm was blamed for at least 45 deaths and 10 injuries. Damage was estimated at $125 million for the seven counties adjoining the Los Angeles area and $10 million in the Central Valley. Additional heavy losses occurred in the Salinas Valley. Heavy snow fell in the mountains.

Southern California was again the victim of a severe storm of rain and snow on Feb. 20-25. At least 12 persons were killed by mudslides and snowslides and 5 were drowned. Utilities were disrupted, and more than 6,000 persons had to be evacuated from their homes. Much farmland was inundated with widespread loss of crops and livestock. Mountain snowfall approached the greatest of record. Property damage was at least $50 million and 6,000 persons had to be evacuated from their homes.

A tornado, hurricane-force winds and up to 11-inch rains battered the middle and upper Texas coast on February 13-14. Tides and high seas, up to 25 feet offshore, were the worst since hurricane Carla. Seven persons lost their lives, and property damage exceeded $6 million.

A devastating combination of wind and hail struck the lower Rio Grande Valley of Texas on May 12, causing at least $10 million damage to crops and $4 million to property. Hail averaging near an inch in diameter but varying from 1/2 to as much as 4 inches and high winds severely damaged or completely destroyed 80,000 to 85,000 acres of valuable crops such as melons, citrus, vegetables, and cotton.

Wind and hail in west-central and southern Iowa on June 28 injured 8 persons and caused at least $10 million damage to crops and property.

In central, east-central, and the northeast quarter of Kansas on June 21-22, hail, winds with measured gusts (unofficial) up to 104 m.p.h. at Kanapolis Dam, and lightning moved across seven counties. Fifty-six persons were injured and total damage exceeded a half million dollars.

On June 15 rain and hail in New Mexico caused $2 million damage to crops and property in Belen, and $3 million in Dona Ana County.

Statewide heavy rains, wind, hail, and lightning in Tennessee on June 23 took two lives, injured one person, and caused $8.6 million damage. In middle Tennessee 6 to 8 inches of rain fell in a 6- hour period. Winds gusted to 60 m.p.h.

Wind, rain, and hail caused heavy crop and property damage in the southern tier of counties of Wisconsin on June 29. Flood and crop losses were believed to be in excess of $10 million.

Rain, wind with gusts up to 80 m.p.h., and up to 2 3/4-inch hailstones struck the greater Kansas City, Mo., area and moved eastward to Saline County on July 9. Damage exceeded $5 million.

Heavy rains and melting snows caused a massive landslide in the Beaver Falls area of Alaska on November 28. An electrical generator was buried, causing a loss in excess of $1.5 million.

On July 4-5, 4 to over 11 inches of rain fell on 21 counties in northern Ohio between 6 p.m. of the 4th and 11 a.m. of the 5th. Wind gusts up to 100 m.p.h. and severe lightning accompanied the first line of thunderstorms, causing at least 15 deaths and considerable property damage. The heavy rainfall resulted in record floods in a number of streams, and 26 persons were drowned. Total storm losses included 41 deaths, 559 injuries, and over $65 million in damages.

FLOODS.--The snowmelt floods of March to May in the Red River of the North, Upper Mississippi, and the Missouri Basins caused 8 deaths and estimated property losses of $175 million.

Record flooding occurred in the mountains of western Virginia in the Upper James River Basin during the night of August 19-20 during the passage of the remanents of Hurricane Camille. Total rainfall ranged up to 12 inches at official stations and substantiated amounts up to 31 inches at other locations. The heavy rains caused landslides as well as flooding. As a result of the disaster 151 persons were reported dead or missing and damage in the State was estimated at $140 million which was included in the total damage of $1.42 billion caused by Camille.

EXCESSIVE PRECIPITATION

(Excessive Short Duration Rainfall)

Year 1969

This table contains statistics of maximum amounts of rainfall during the calendar year 1969. Data presented in this table are generally from stations equipped with recording gages. Stations are at Airport locations unless otherwise shown.

Excessive precipitation data for the years 1896-1935 inclusive, generally present the accumulated amounts of precipitation for each 5, 10, or 20 minute intervals during storms in which the rate of fall equaled or exceeded .25 inch in any 5 minute period, or .30 in any 10 minute period, or .35 in any 15 minute period, etc., the tabulation beginning with the 5 minute period where the rate of .05 inch in 5 minutes began and continuing by 10 or 20 minute intervals up to 120 minutes. A detailed explanation of the method used may be found in the publications listed in the last paragraph of this explanation.

The present method, adopted with data for the calendar year 1936, gives the maximum fall of precipitation for the periods 5 to 180 minutes, the maximum amounts being taken for the periods in which the fall is greatest for the given time, and is tabulated to show maximum amounts for 5, 10, 15, 20, 30, 45, 60, 80, 100, 120, 150 and 180 minutes, even if the fall does not equal the excessive rate for some of the periods. (The 15 minute amount was not computed for 1936-43 and the 150 minute amount was not computed for 1944 through 1948).

The following Table A shows limits at which precipitation was considered excessive in this publication:

TABLE A

Duration (minutes)	Depth of precipitation (inches)	Duration (minutes)	Depth of precipitation (inches)
5	.25	60	.80
10	.30	80	1.00
15	.35	100	1.20
20	.40	120	1.40
30	.50	150	1.70
45	.65	180	2.00

This table is made up from the formula, $A = t + 20$ where A is the accumulated depth in hundredths of inches and t is the time in minutes.

For the years 1936 through 1948 stations in North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Tennessee, Arkansas, Louisiana, Texas, Oklahoma, and San Juan, P. R., used the limits shown in the following Table B:

TABLE B

Duration (minutes)	Depth of precipitation (inches)	Duration (minutes)	Depth of precipitation (inches)
5	.40	60	1.50
10	.50	80	1.90
15	.60	100	2.30
20	.70	120	2.70
30	.90	150	3.30
45	1.20	180	3.90

This table is made up from the formula $A = 2t + 30$. Its use, however, was discontinued at the end of 1948 and Table A is used by all sections for 1949 and the following years.

Publication of Data. A summary of maximum precipitation data for the years prior to 1896 is published in the annual report of the Chief of the Weather Bureau for 1895-1896. Excessive precipitation data for the period 1881-1896 are published in the annual report of the Chief of the Weather Bureau 1896-1897. Data for the years 1897 through 1934 have been published in the appropriate annual reports of the Chief of the Weather Bureau. For the years 1935 through 1949 these data are published in the appropriate issue of the United States Meteorological Yearbook. For 1950 and succeeding years, excessive precipitation is presented in the annual issues of the Climatological Data National Summary.

RECORDING GAGE DEFECTIVE 5/1-12/31/69

Data from airport unless otherwise specified.
U indicates Urban, R indicates Rural, sites.

* Maximum of record for this duration and station. Period of record is that compiled in Weather Bureau Technical Paper No. 2, revised, plus 1962 and 1963 data. New records are denoted only for 5, 10, 15, 30, 60, 120, and 180 minutes. The continuity of record at stations that have changed location is described on page 2 of the above reference

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month

Wind directions under resultant direction are in tens of degrees

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated

\+ And also on an earlier date or dates

* Includes all forms of frozen precipitation, except hail occurring alone

A Moved from Municipal AP to Regional AP October 16

C Moved from Hobby AP to Intercontinental AP June 1

B Number of days maximum 70 F or above for Alaskan Stations

Y Peak gust

V Sun below horizon November 19 - January 23, inclusive

X Sun below horizon November 24 - January 17, inclusive

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

Data in this table are obtained by conversion from data in the English Units table.

† Includes all forms of frozen precipitation, except hail occurring alone.

+ And also on an earlier date or dates.

A Moved from Municipal AP to Regional AP October 16.

B Number of days maximum 21.1°C or above for Alaskan Stations.

C Moved from Hobby AP to Intercontinental AP June 1.

Y Peak gust.

\ Sun below horizon November 19 - January 23, inclusive.

X Sun below horizon November 24 - January 17, inclusive.

* Less than 0.05.

Data from airport or from airport and urban site records combined.
U indicates Urban, R indicates Rural sites.
Data in this table are based on records through 1969 except as indicated in notes.
Date after station name indicates last year included in summarization data.
Normal values are based on the period, 1931-1960 and are means adjusted to represent observations taken at the present standard location.
Degree days are based on a daily average of 65 F.
For detailed periods of record see ANNUAL LOCAL CLIMATOLOGICAL DATA, 1969.
Fastest mile is the fastest speed, in miles per hour, of any mile of wind movement recorded on an automatic recording wind instrument.
Refer to the Annual Climatological Data Table for stations reporting the fastest one-minute wind speed instead of fastest mile.

Clear Day averages 0-3 tenths sky cover, Partly Cloudy 4-7 tenths and Cloudy 8-10 tenths.
Heavy Fog includes data formerly referred to as "Dense" or "Thick". The upper visibility limit for heavy fog is 1/4 mile.
* Less than one-half.
B Number of days Maximum 70° or above (Alaskan stations).
\+ Relative humidity means for period of record through 1960.
: Mt. Washington excluded.
ø Estimated amounts during typhoon.
1/ Means and extremes are from post office location through 1962.
2/ Based on records from Urban office through January 1943 airport through June 1964.

c Relative Humidity readings 8 a.m. and Noon local time.
e Reopened 1963.
T Trace, an amount too small to measure.
x Sun below horizon continuously Nov. [illegible] - Jan. [illegible].
y Sun below horizon continuously Nov. [illegible] - Jan. [illegible].
(x and y)-Yearly totals for period sun above horizon.
m Record for 1949-1951, 1958-1962.
r Resumed 1965.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.
These are the elevations of the barometer (in feet and meters above mean sea level) to which station pressure values pertain in the "Climatological Data" table in the monthly publication CLIMATOLOGICAL DATA NATIONAL SUMMARY.

GENERAL SUMMARY OF TORNADOES, 1969

Esther K. Grabill
Environmental Data Service
Environmental Science Services Administration
Washington, D. C.

A total of 604 tornadoes was reported in the United States in 1969. These occurred on 155 days, causing 66 deaths and millions of dollars of property damage. Only 8 of the 50 states escaped these devastating storms in 1969: Alaska, Connecticut, Delaware, Hawaii, Nevada, New Jersey, Oregon, and Rhode Island. More than 85% or 517 of the total tornadoes occurred in the 5-month period April through August. Although tornadoes were reported in every month of the year, the peak of 144 occurred in May. Some of the worst outbreaks are described briefly in the following paragraphs.

The year's first tornado on January 23 cut a 120-mile path from Jefferson through Copiah, Simpson, Smith, Scott, and Newton Counties in Mississippi, killing 32 persons and injuring 241. Total devastation existed where the tornado struck. Property damage was estimated at $2 million.

On April 18, a tornado touched down in at least nine areas extending from the southwest corner of Georgia to near the coast. The distance from the first reported damage in Seminole County to Fleming in Liberty County is almost 250 miles, one of the longest tracks of any Georgia tornado. About 30 persons were injured, and 19 mobile homes and 60 to 70 farm buildings were demolished. Tremendous timber losses were reported in the Douglas area. Damages were estimated at $2 million. Three tornadoes struck in Matagorda County, Texas, on the 11th of April, all within about 40 minutes. The most destructive of these destroyed or heavily damaged 178 houses on either side of Carney Creek, 6 miles south of Sargent. Twelve persons were injured. Another Texas tornado on the 27th hit the Villa Caseta Mobile Home Park, 1 mile northwest of Plano; 42 persons required hospitalization. Of the 72 homes in the park, 30 were completely destroyed and many of the others received major damage.

On May 8 a tornado hit and skipped over a 3-mile residential area south of Dayton, Ohio, and continued for another 15 miles to Cedarville. It injured 28 persons and caused an estimated $3 million property damage. A total of 13 homes was demolished, 63 suffered major damage, and 101 sustained minor damage. The tornado at Butler County, Ohio, on the 10th caused an estimated $1 million property damage.

On June 21, a tornado moving east-southeastward first touched down in the southwest part of Salina, Kans., causing an estimated $10 million damage. Major damage occurred to 104 homes; 571 others were slightly damaged, and 7 business structures were destroyed. A tornado on the 22d moved from Doe Run to Libertyville, Mo., killing 4 persons and injuring 14. A total of 22 homes were completely destroyed and 90 damaged; numerous barns, outbuildings, power and telephone lines were leveled. In the Perkins-Ripley, Okla., area, a tornado on the 23d damaged or destroyed 13 homes, killed some livestock, and uprooted numerous trees; damage was estimated at one-half million dollars. A tornado in northern Clark County, Wis., on the 26th of June, injured 2 persons and damage 10 farms; at Taylor County Airport, 7 planes and 1 hangar were severely damaged; additional damage and 2 injuries occurred near Pelican Lake and Crandon; major damage occurred on 5 farms at Skanawan and Harrison. The tree and wire damage was termed the worst by utilities in northern resort areas. One of the most destructive tornadoes hit New York State on the 20th and demolished or heavily damaged homes, trailer homes, barns, silos, and a number of miscellaneous buildings in the communities of Clymer, Sherman, Bemus Point, Jamestown, Conewango Valley, Conewango, and Little Valley.

On July 4 a tornado moved eastward from the southeast corner of Washtenaw County through southern Wayne County, Mich., in a 15-mile path of destruction. Total losses were estimated at $2 million.

The 3 most damaging of 12 Minnesota tornadoes that occurred on August 6 are the following: The "Backus" tornado destroyed 13 farmsteads and 11 homes, hospitalized 4 persons, and caused numerous minor injuries. Damage to property, timber, and utilities was estimated at $850,000. In the "Outing" tornado 12 persons were killed; damage to property, utilities, and timber was estimated at $2,150,000. The "Floodwood" tornado killed 39 head of livestock and damaged property and public utilities at an estimated $845,000. A tornado in the Cincinnati, Ohio, area on the 9th killed 4 persons, injured 247, and left approximately 1,500 persons homeless. Within the tornado's path, 27 homes were demolished, 200 were heavily damaged, and 2,300 others had minor damage; 25 businesses and 100 mobile homes also were damaged or destroyed. Total damage was estimated at $10 to $12 million in Hamilton County and $200,000 in Clermont County.

A tornado on October 12 in the Texas Greater Dallas Metropolitan area injured 3 persons. Property damage was estimated at $600,000, of which about $400,000 was in Garland.

The most damaging tornado to strike any area in Washington occurred on December 12 in the southern Puget Sound area. Buildings and garages were damaged or destroyed, and powerlines were downed. The most extensive damage occurred near the Green River in the Kent Valley.

Although Puerto Rico has not had a tornado since 1962, 2 were reported in 1969.

The tables, figures, and tornado tracks on the following pages include additional information to supplement the above summary.

NORTH ATLANTIC TROPICAL CYCLONES, 1969

Richard M. DeAngelis
Environmental Data Service
Environmental Science Services Administration
Washington, D. C.

A late July start in the hurricane season did not result in a below average year; on the contrary a total of 13 tropical cyclones, 10 of which reached hurricane strength, was much above the latest 30-year average of 9.3 tropical cyclones, 5.7 of which reach hurricane strength. This was the most active season since 1953 when 14 tropical cyclones developed, and six of them reached hurricane strength. Nine hurricanes formed in August, September, and October, a figure which had not been attained since the 1955 season. Hurricane Martha was the latest forming hurricane since Alice formed on the next to the last day of the year in 1954. She was also the first tropical cyclone to hit Panama. Loss of life, attributed directly or indirectly to tropical cyclones, was the highest in the United States since 1957. The 256 deaths were all attributed to Camille; this high total was due largely to the disastrous Virginia floods which accounted for nearly half of the total. There were 68 persons missing in addition to the deaths. Outside of the United States, three persons died in Cuba during Camille; Francelia caused about 100 deaths with $4.7 million damage in Guatemala due to floods; Martha caused five deaths in Costa Rica. Camille was also responsible for most of the damage in the United States with a $1.42 billion total--equaling the record set by hurricane Betsy in 1965.

The tracks of 1969 tropical cyclones are shown in the accompanying chart.

TROPICAL STORM ANNA, JULY 23-AUGUST 5

The first tropical storm of the season had its beginnings west of Senegal, Africa, on July 23 and became an organized depression late on the 24th. The christening took place near 11°N., 36°W., when Anna reached tropical storm strength.

Maximum winds reached 50 kt. on the 28th near 13° N., 40° W., and a peak of 60 kt. on the 30th near 15° N., 51° W. Minimum pressure during this period fell to a low of only 1002 mb. Anna's west-northwesterly movement began to change toward the northwest, and she started to lose her identity. From the 31st to the 1st of August she ambled along in a dissipating depression stage. Then on the 1st she regained her impetus as she turned northward. By late on the 2d, about 120 mi. east of Cape Hatteras, Anna became a tropical storm again. The storm finished recurving and headed toward the North Atlantic shipping lanes. On the 4th the SUFFREN, near 42° N., 32° W., or just southeast of Anna's center, encountered gale-force winds, while 12 hr. later the WESTDALE was rocked by 45-kt. winds from the now extratropical storm. Early on the 5th Anna was absorbed by a 990-mb. extratropical cyclone near 46° N., 30° W.

HURRICANE BLANCHE, AUGUST 6-13

Blanche became a tropical depression on the 10th, a hurricane on the 11th, and turned extratropical on the 12th. Her initial impulse can be traced back to the 6th, some 1,000 mi. east of the Windward Islands. It wasn't until she reached 28° N., 72° W., on the 10th, that she acquired the characteristics of a tropical depression. Things developed quickly from that point. A vessel reported 40-kt. winds and a 1006-mb. pressure, and Blanche was upgraded to a tropical storm on the 11th as she headed north-northeastward. Reconnaissance aircraft found a hurricane later in the day as the central pressure fell to 997 mb. near 36° N., 70° W. Winds reached a peak early on the 12th when the LUOSSA was shackled by 80-kt. winds. From this the lowest central pressure was estimated at 992 mb. Blanche turned toward the northeast and came within 60 mi. of Nova Scotia before turning extratropical later in the day. As an extratropical storm she brushed Cape Race, Newfoundland, with 30- to 40-kt. winds before becoming part of a large low-pressure system in the northern North Atlantic.

HURRICANE CAMILLE, AUGUST 5-22

Camille was spawned by a tropical wave that had moved off the African coast on the 5th of August. This inverted "V" cloud pattern travelled westward and was recognized as a tropical disturbance on the 9th, about 480 mi. east of the northern Leeward Islands. The following day the disturbance, still showing no circulation, moved through the Leewards causing rains throughout the Islands. Then each succeeding day, satellite pictures revealed increased curvature and banding. On the 14th reconnaissance aircraft flew into the disturbance, which they found south of Cuba. The pentration disclosed a 999-mb. pressure center and 55-m.p.h. surface winds -- tropical storm Camille was christened.

The storm moved northwestward at 9 m.p.h.; pressure fell to 991 mb. late on the 14th, and to 964 mb. with 100-kt. winds the following day. At this time Camille was a full-blown hurricane located 60 mi. southeast of Cape San Antonio, Cuba. Havana's weather radar tracked the hurricane across the western tip of Cuba on the evening of the 15th. Camille generated 92-m.p.h. winds at Guane, and spread 10-in. rains over the western sections of the Island. Three persons were reported killed.

Once into the Gulf of Mexico, the small, powerful hurricane intensifed rapidly; by the early afternoon of the 16th central pressure had dropped to 908 mb. The severe storm plodded north-northwestward at 14 m.p.h. A hurricane watch had been put in effect from Biloxi, Miss., to St. Marks, Fla. By late afternoon an Air Force reconnaissance team measured a 905-mb. pressure and recorded flight level (700 mb.) winds of 160 m.p.h.

Early on the 17th, with Camille 250 mi. south of Mobile and hurricane warnings extending westward to New Orleans, Mississippi coastal residents were boarding up homes and businesses and heading inland. As the day wore on inland moving traffic increased as did the hurricane threat to low-lying areas. Radio and television stations carried ESSA warnings every few minutes, while Police and Civil Defense officials went into isolated areas to urge people to evacuate.

One last reconnaissance flight was made early Sunday afternoon (17th), and Air Force pilot Marvin A. Little and his crew estimated maximum surface winds at more than 175 kt. near the center. Due to engine trouble this was the last penetration made. Hurricane force winds extended out to 60 mi.; Camille was a small but extremely intense hurricane located less than 100 mi. from the mouth of the Mississippi River. The storm was at its peak and was under surveillance of the New Orleans radar.

As Camille brushed southeastern Louisiana easterly winds ahead of the center and northerly winds to its

west pushed a massive storm surge through the marshes of this area. Because of the shape of bays and inlets, surge heights varied at different locations; water levels reached 9 ft. above m.s.l. near the mouth of the Mississippi, at Garden Island. In several places from the Empire Canal southward to Buras, Boothville, and Venice the surge poured over both the east and west bank Mississippi River levees and was trapped by the back levee, leaving the built-up areas between the levees severely flooded.

The center of Camille made landfall on the now nearly-deserted Mississippi coast at about 10:30 p.m., c.s.t. on the 17th; she passed over Clermont Harbor, Waveland, and Bay St. Louis. There were no records of winds near the center and estimates ranged up to 175 kt. The storm surge reached a devastating 24.2 ft. above m.s.l. at Pass Christian and was near 10 ft. above m.s.l. as far east as the Mississippi-Alabama border. At the west end of the Bay St. Louis Bridge there was a pressure report of 26.85 in. (909.3 mb.).

Camille weakened as she moved northward through Mississippi, passing close to Columbia, Prentis, Jackson, Canton, and Greenwood. Jackson's winds gusted to 67 m.p.h. as the storm center passed 10 mi. to the east. The radar at Jackson, which had picked up Camille's eye in the Gulf, followed the identifiable circulation to southern Quitman County. The storm was only identifiable as a depression when it reached the northern Mississippi border.

The depression stages of Camille were tracked northeastward through western Tennessee, east-northeastward through central Kentucky, and eastward through extreme southern West Virginia and southern Virginia. Late on the 19th, a combination of factors interacted to produce several areas of concentrated, torrential rainfall that caused devastating flash floods and landslides along the eastern slopes of the Blue Ridge Mountains and record flooding along the James River system.

The remnants of Camille's dying circulation moved into an area already occupied by a large, moist maritime-tropical air mass, with some existing rain areas. To the northwest of the area of maximum rainfall a narrow valley surrounded by steep ridges suggested that orographic effects on the cyclonic flow aided in producing the heavy precipitation. Thunderstorm activity ahead of a slowly approaching cold front may also have accentuated the heavy rain. In combination these meteorological factors (and perhaps others not yet ascertained) produced torrential rains which rank with other record rainfalls throughout the world. Several amounts of more than 25 in. were found on post examination, and amounts in excess of 4 in. fell over an area 30-40 mi. wide and 120 mi. long -- most of it occurring in a period of 8 hrs.

Camille regained tropical storm intensity when she moved into the North Atlantic. However, on the 22d, she was absorbed by a cold front about 175 mi. southeast of Cape Race, Newfoundland.

The highest actual measurement on a wind instrument was found on an Easterline Angus wind speed recorder which had been left running on a Trans-world Drilling Co. rig located east of Boothville (Maine Pass Block 29). The recorder had been switched to double scale before evacuation and recorded an extreme gust of 172 m.p.h. before the paper jammed and the trace was lost. An Air National Guard Weather Flight stationed at Gulfport Municipal Airport, estimated sustained winds in excess of 100 m.p.h. and gusts of 150-175 m.p.h. Other less reliable reports from the Gulfport-Bay St. Louis area indicated winds of 150-200 m.p.h. At Boothville, La., 107-m.p.h. gusts were recorded before a power failure; at Pilottown, La., the SS CRISTOBAL estimated winds at 160 m.p.h.

Winds at Biloxi (Keesler AFB) were measured at 81 m.p.h. with gusts to 129 m.p.h. late on the 17th. At Ingalls Shipyard in Pascagoula the highest sustained wind reached 81 m.p.h. while a local radio station reported 104-m.p.h. winds before power failure.

West of the storm center hurricane force winds reached only the eastern edge of New Orleans; brief gusts of 50-75 kt. extended over most of the city. Eastern sections of St. Tammany and Washington Parishes were swept by intense winds estimated up to 160 m.p.h. in gusts at Slidell and up to 130 m.p.h. in gusts at Bogalusa and Angie.

Hurricane force winds were confined close to the storm's center as it moved inland. These winds extended from east of New Orleans to Pascagoula, while gusts of hurricane force winds extended along the coast from New Orleans to just west of Mobile Bay and inland to just south of Jackson.

Camille's lowest pressure of 905 mb. (26.73 in.) was second only to that of the Labor Day Hurricane of 1935, in which a 26.35-in. (892 mb.) pressure was recorded in the Florida Keys. This stands as the lowest pressure in the North Atlantic; the world record low pressure was recorded in typhoon Ida on September 24, 1958 -- 877 mb. (25.90 in.).

The 908-mb. pressure recorded on the afternoon of August 16 marked the lowest ever recorded by reconnaissance aircraft in the North Atlantic; however, this was soon broken by the 905-mb. reading later in the day.

The lowest land pressure was observed by Mr. Charles A. Breath, Jr. of Bay St. Louis, in his home a few blocks from the west end of Bay St. Louis Bridge. He made the reading of 26.85 in. on his aneroid barometer as the eastern edge of Camille's eye passed overhead. His barometer was later checked and found to be accurate by the New Orleans Weather Bureau Office. Other low pressures included a 27.80-in. reading at Garden Island, La., and a 27.90 in. at St. Stanislaus School in Bay St. Louis.

The storm surge generated by Camille flooded coastal areas from lower Plaquemines Parish in Louisiana to Perido Pass, Ala. Flooding was most severe in the Pass Christian - Long Beach, Miss., area where tides up to 24.2 ft. above m.s.l. were measured. In the St. Louis Bay maximum tides ran 18 ft. above m.s.l., while in the Back Bay of Biloxi they were about 15 ft. above m.s.l.

A chart of the storm surge measurements and flooded areas is shown. This chart is based on a series of 15 maps of scale 1 in. to 2,000 ft. extending from near the mouth of the Pearl River to Bayou La Batre, Ala., and indicates in detail the areas flooded and surge measurements. These maps are available from the U. S. Geological Survey, Washington, D. C. 20242. Additional information for this summary was obtained from the Mobile District Corps of Engineers.

The Louisiana storm surge that swept from Empire southward, flooded Boothville with 15 ft. (above m.s.l.) of water. Water levels reached 9 ft. near the mouth of the Mississippi, at Garden Island. The tidal surge also flooded some parts of lower St. Bernard Parish and eastern sections of Orleans Parish. Tide heights reach-

ed 7.97 ft. above m.s.l. at Alluvial City, 8.73 ft. at Chef Menteur Pass, 11.06 ft. at Shell Beach, and 9.00 ft. at the Rigolets. Tides on Lake Pontchartrain reached 4.0 ft. above m.s.l. at Mandeville, 4.6 ft. at Frenier, 5.2 ft. at Slidell, and 5.5 ft. at Madisonville.

A serious drought had plagued Mississippi, Tennessee, and Kentucky for many weeks preceding hurricane Camille. Soil moisture was much below normal, pasture conditions were poor, and crops were suffering; Camille's rains relieved the drought in some areas and eased it in western Tennessee, where it had been severe. Rainfall amounts of 3-5 in. fell over western Tennessee and southern West Virginia. In some sections the rains were a few weeks too late to prevent serious loss of crops, some grains were badly damaged, and most farmers were feeding cattle their winter supply of hay. A detailed breakdown of hourly and daily precipitation amounts at numerous stations may be found for every state, in the EDS publication Hourly Precipitation Data, Daily Totals, available at the National Weather Records Center, Asheville, N. C.

As the weak and seemingly innocuous low pressure center associated with Camille crossed the Blue Ridge Mountains into southwestern Virginia, rainfall reached catastrophic proportions in that area. Results of a bucket survey conducted by the Weather Bureau showed that 12-14 in. totals were common in Nelson County and the southern part of Albemarle County. The poststorm survey showed a 27-in. total near Massies Mill and an unconfirmed report of 31 in. near Tye River, Va. Figure 2 shows the storm rainfall analysis as made by the Office of Hydrology's Hydrometeorological Branch.

The 27-in. rainfall total in Nelson County, Va., which fell within about 8 hrs., represents one of the all-time meteorological anomalies in the United States. A study made by the Weather Bureau in 1956 for the Corps of Engineers concluded that the probable maximum rainfall possible in this area was 28 in. in 6 hours and 31 in. in 12 hrs. The previous record rainfall in Virginia was 8.4 in. in 12 hrs. at Big Meadows on the Skyline Drive, associated with a hurricane in 1942. For purposes of comparison, this catastrophic rainfall from Camille may be compared with the following records:

12 in. in 42 min. at Holt, Mo., in 1947
19 in. in 2 hrs., 10 min., at Rockport, W. Va., in 1889
22 in. in 2 hrs., 45 min. at D'Hanis, Tex., in 1935
31 in. in 4 hrs., 30 min., at Smethport, Pa., in 1942
34 in. in 12 hrs. at Smethport, Pa., in 1942

The Virginia part of Camille was one of nature's rare events. It is estimated that the maximum rainfall associated with this storm has a return period well in excess of 1,000 yrs. Another measure of the rarity of this rainfall is that the maximum amount of 31 in. (unconfirmed) approaches the probable maximum rainfall that meteorologists have computed to be theoretically possible in Virginia at this time of the year. The U. S. Geological Survey estimates that the return period of the crest discharge for the James River at Cartersville, Va., is 200 yrs. Even longer return periods are estimated for crest discharges at upstream stations.

The torrential rains associated with the remnants of hurricane Camille caused one of the worst flood disasters to strike the State of Virginia.

Extensive severe flash flooding occurred in the following counties: Albemarle, Alleghany, Amherst, Bath, Botetourt, Buckingham, Cumberland, Fluvanna, Goochland, Nelson, Orange, Powhattan, and Rockbridge. Hardest hit by the flash flooding were the Tye River and Rockfish River Basins, which lie mostly within Nelson County. Flash flooding also reached disaster proportions in Rockbridge, Amherst, Albemarle, and Fluvanna Counties. Devastating and extreme flash flooding occurred in the Maury and Hardware Basins and in portions of the Rivanna Basin.

Most of the residents of the mountain hollows, hamlets, and towns were asleep during the fatal hours of the storm. Rapidly rising streams and landslides caused by the unprecedented rainfall destroyed homes as the occupants slept. Large trees were uprooted and hurled down the mountain. They acted as battering rams, crashing through houses, overturning automobiles, sparing nothing in their paths. Entire families were swept away in the raging waters. Whole sections of the mountainside slid down in the form of mud, heaping tons of silt on houses and their inhabitants. Many houses at higher elevations were damaged by mountain water runoff.

The Virginia Civil Defense Headquarters estimated the total flood damages in Virginia at $140 million. The total number of deaths in Virginia by drowning and mudslides was placed at 110 with an additional 41 persons missing and presumed dead. The State was declared a disaster area by the President. One million dollars in federal aid was made available immediately for repair and replacement of roads, bridges, and other public facilities.

The remnants of Camille, as it moved through extreme southern West Virginia, produced 3 to nearly 5 in. of rain over the southern counties of that State. Nicholas, Greenbrier, and Summers Counties were hardest hit with flash flooding along the Greenbrier, Meadow, and Cherry Rivers. The Greenbrier River at Alderson, W. Va., crested at 17.1 ft. early on the 20th; 3.1 ft. above flood stage. High water from Spring Creek, a small tributary entering the Greenbrier near Renick, W. Va., resulted in the deaths of two elderly women. Total damage in West Virginia was estimated at $750,000.

DEATHS AND DAMAGES

Hurricane Camille ranks high as one of the most destructive killer storms ever to hit the U. S. Total damage has been estimated at $1.42 billion with 256 deaths and 68 additional persons missing -- this includes the Gulf Coast and the Virginias. In round figures the damage equals the destruction caused by hurricane Betsy, in a much more concentrated area, in September of 1965. Betsy and Camille stand together as the two most destructive storms to ever ravage the U. S.

While most of Betsy's damage was incurred by Louisiana, Camille spent most of her wrath in Mississippi; the total figure there is estimated at $950 million; Louisiana suffered $350 million mostly in lower Plaquemines Parish.

The total U. S. deaths figure was 256, with three persons reported dead in Cuba. The U. S. figure is the highest in a hurricane since 390 persons died during hurricane Audrey, which moved over western Louisiana in June 1957; most of these deaths, like those in Camille, were drownings.

A detailed summary of Hurricane Camille appears in the August ESSA's Climatological Data, National Summary, Vol. 20, No. 8, 1969.

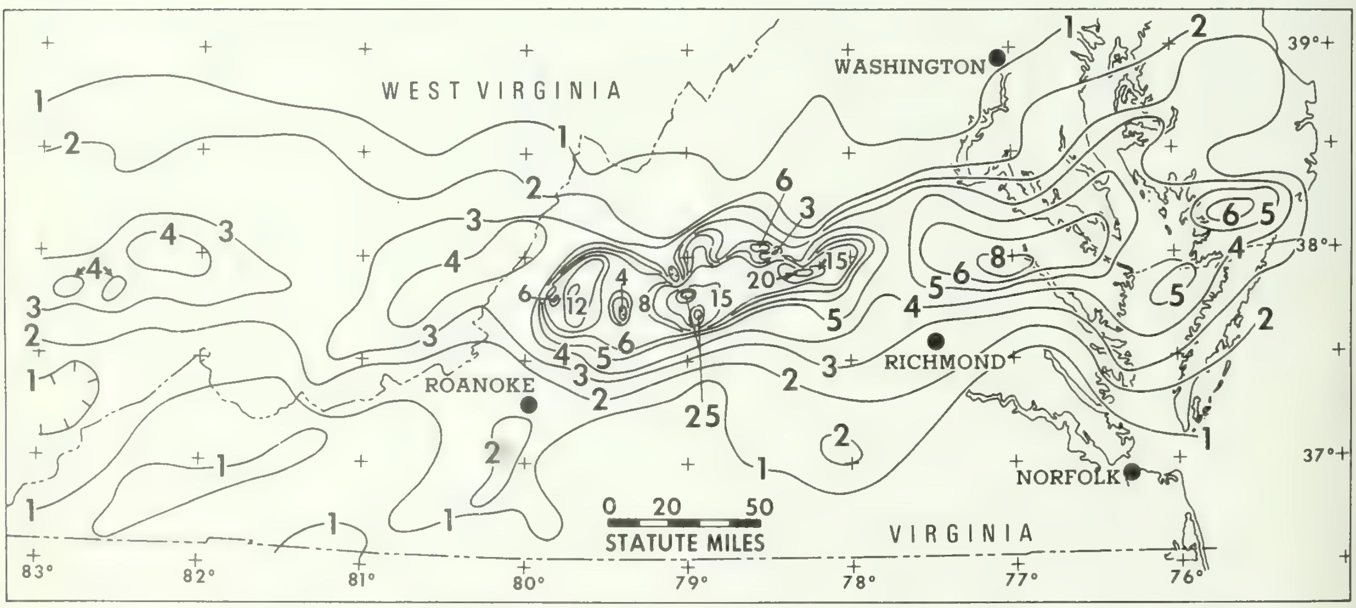
Figure 2.



CAMILLE RAINFALL (IN.)
AUG. 19TH NOON TO AUG. 20TH MIDNIGHT 1969

HURRICANE DEBBIE, AUGUST 13-25

A tropical wave intensified and became tropical storm Debbie at 1200 on the 15th. The storm intensified slowly as she moved west-northwestward for the next 36 hrs. Debbie then turned toward the northwest, decreasing the threat of her 70-kt. winds in the Leeward Islands. Her winds increased to 90 kt. as she followed this northwesterly course for the next two days. Debbie turned toward the west-northwest again late on the 19th. Moving at a forward speed of 13 kt., the hurricane crossed the 25th parallel early on the 20th. She was at peak strength at this time; central pressure had dropped to 950 mb. with winds around 110 kt. Gale-force winds extended out 200 mi. to the north and 100 mi. to the south of the center.

Debbie began to recurve on the 20th and was heading northeastward before reaching the 65th meridian. She was generating 95-kt. winds around a 964-mb. center as she passed about 225 mi. east of Bermuda early on the 22d. Twelve hours earlier the B. A. PEERLESS, near 30° N., 62° W., encountered 70-kt. southeasterly winds and a 1003-mb. pressure. Winds near the center were as high as 90 kt. as Debbie moved northward on the 24th. However, winds dropped below hurricane force late on the 24th as Debbie passed about 50 mi. east of St. Johns, Newfoundland, sweeping that city with 55-kt. gusts. By the 25th the 988-mb. cyclone was extratropical and located off southeastern Greenland; winds remained at 45 kt. until the storm crossed Iceland on the 27th.

TROPICAL STORM EVE, AUGUST 24-27

Tropical storm Eve formed about 130 mi. east of St. Augustine, Fla., on the evening of the 24th. The following afternoon she reached tropical storm strength and later in the day reached a peak when pressure dropped to 995 mb. and winds reached 50 kt. Eve was moving toward the east-northeast at about 8 kt. Eve was never very well organized, and it didn't take much to turn her extratropical. Late on the 26th near 32° N., 72° W., enough cold air had entered the circulation, and Eve was an extratropical trough of low pressure with occasional squalls reaching 35 kt.

HURRICANE FRANCELIA, AUGUST 19-SEPTEMBER 4

Satellite pictures received on the morning of the 27th showed a tropical disturbance with a rather large mass of cloudiness near 11.5° N., 54.0° W., or 400 mi. east-southeast of Barbados. Maximum winds were estimated at 25-30 kt. The disturbance was moving west-northwestward at about 13 kt. Although Barbados reported a wind gust of 37 kt. at 1200 on the 28th, a Navy reconnaissance aircraft found only a wavelike formation accompanied by considerable weather but no evidence of a closed circulation. The wave passed over the Windward Islands late that day.

Once over the eastern Caribbean the wave weakened, and bulletins on it were dropped for over 1 day. Then at 1200 on the 30th, the KORDUN near 12.5° N., 70.0° W., sent a report of a south-southeasterly wind of 35 kt. and a 1008-mb. pressure. The disturbance had developed into a depression about 12 hrs. earlier, and this depression was intensifying. By 1900 on the 30th, Francelia was born; she was lacing the Barhona Peninsula of Haiti, 250 mi. to the north, with squalls.

Francelia continued toward the west-northwest, but never did get well organized until late on the 1st when she became a hurricane. Earlier on the 31st, reports from passing vessels indicated that Francelia was in a disorganized state with a rather broad area of low pressure and possibly several small centers. By late on the 1st, however, winds were up to 75-80 kt.; the eye of the storm passed over Swan Island about 2145. The ESSA Weather Bureau observers on Swan Island were successful in launching a radiosonde into the eye of Francelia. The relative calm of the eye lasted for 1 hr. -- long enough for the men to make this very important observation. Only four previous ascents have been made in hurricanes. These were in Inez (1966) at Boca Chico, Fla.; two at the Tampa, Fla., Weather Bureau (1944, 1946); and in Arlene (1963) as the center passed over Bermuda. Swan Island reported a lowest pressure of 994 mb. and wind gusts to 60 kt. There were no injuries.

Francelia took a turn toward the west-southwest on the 2d, aiming her fury at southern British Honduras. By 2000 that day, top winds were 100 kt. and the minimum pressure was 973 mb.; by 0100 on the 3d, gale-force winds had been reported from Tela, Honduras. The hurricane came to a virtual standstill about 30 mi. east of Punta Gorda, British Honduras, early on the 3d. The RIO COBRE near the center of the storm was hit by wind gusts of 85-90 kt. at 1500 that day. Francelia started drifting westward about midday on the 3d, and by 2200 her eye was over Punta Gorda. That city fought winds of 95 kt. in the southeast wall cloud; the lowest pressure recorded was 991 mb.

As the 4th opened, Francelia was breaking up over the mountains and hills northwest of Punta Gorda, but torrential rains were plaguing British Honduras and Guatemala. Residents along rivers, streams, and gorges were warned to exercise a sharp vigil for high water and flash flooding caused by rains of 10-20 in. The northern coast of Honduras was already suffering from severe flooding, and the railroad and highways between Puerto Cortez and Tegucigalpa were washed out. The Macal River in southern British Honduras ran 20 ft. above normal. The Guatemalan ports of Matios de Galvez and Puerto Barrios reported flooding, particularly in the Customs Warehouses, due to the heavy rains of the hurricane. About 100 persons died of flooding in Guatemala, while damage was estimated at $4.7 million.

HURRICANE GERDA, AUGUST 21-SEPTEMBER 10

A tropical disturbance, which was traced back to Mali, Africa, spawned a tropical depression in the central Bahamas on the 5th. Climatology indicates that tropical cyclones in this area have a better than 50 percent chance of reaching the U. S. mainland. The next day this depression moved inland near Palm Beach bringing the central east coast of Florida rain but little wind. After moving across Lake Okeechobee, the storm turned toward the northeast and headed back to sea, where it began to slowly intensify.

On the 8th, the tanker ESSO MIAMI reported a 35-kt. wind a short distance east of the storm's center. Then a Navy reconnaissance crew reported a 1000-mb. central pressure with 45- to 50-kt. winds north and east of the center; it was evident that tropical storm Gerda -- seventh tropical cyclone of the season -- had formed. She was again in an area favorable for striking the U. S. mainland.

As Gerda moved northeastward, coastal areas were alerted; however, she remained more than 100 mi. off the Georgia-South Carolina coast. Charleston's winds reached only 17 kt.

Later on the 8th, about 210 mi. south-southwest of Cape Hatteras, Gerda reached full hurricane strength. The ship THORSOY reported a 50-kt. wind a short distance east of Gerda's center. Her forward speed accelerated, and late that evening she moved rapidly past Cape Hatteras. While winds close to the storm's center were about 80 kt., winds at the Cape, some 60 mi. to the west, were 24 kt. with gusts to 31 kt. Gerda's forward speed was now around 35 kt., and she continued northeastward.

By the afternoon of the 9th, Gerda was some 60 mi. east of Cape Cod and generating winds of about 85 kt. around a 980-mb. pressure center. Nantucket recorded a 50-kt. gust as the hurricane passed to the east. As Gerda moved toward the coasts of Maine and New Brunswick at 43 kt., she continued to intensify. The Nantucket Lightship and reconnaissance reports indicated top winds of 125 kt. and a central pressure of 979 mb.

It was in the evening when Gerda moved over Eastport, Me., and northward into New Brunswick; a few hours earlier on the 9th she had been off the Virginia Capes. The following morning Gerda merged with a frontal system and became extratropical as she moved into Quebec.

The coastal areas of the United States were barely affected by Gerda, and there was only minor damage in the areas where Gerda made landfall.

HURRICANE HOLLY, SEPTEMBER 9-21

Hurricane Holly was a good example of a storm deveooping in a favorable tropical environment and then degenerating all the way to an easterly wave after entering an unfavorable environment in tropical latitudes at both the surface and at upper levels. She reached depression status near 12° N., 47° W., around midday on the 14th, and pursued a northwesterly course for the next 2 days. By 2200 on the 14th, she was declared a tropical storm with top winds of about 40 kt.; 18 hrs. later she ripened into a minimal hurricane. Shortly after this Holly reached her lowest pressure (992 mb.) and her highest winds (65 kt.). The hurricane moved to near 16° N., 51° W., by late on the 16th; it was then evident that she had turned to a more west-northwesterly track.

Holly was struggling against a hostile environment. She was moving into an area of relatively cool temperatures east of the Antilles, and a good outflow mechanism in the upper portion of the atmosphere was absent. By late on the 17th she was again a tropical storm near 17° N., 53° W., with highest winds of only 45 kt. Holly continued to weaken on the 18th as she turned to the west-southwest. By 1600 that day she was given depression status; by 2200 Holly was only a tropical wave with maximum winds of 30 kt. This wave moved through the Leeward Islands on the night of the 19th and the morning of the 20th. St. Barthelemy Island reported the highest wind (26 kt.) observed on the Islands. The wave was last detected near longitude 66° W. early on the 21st.

HURRICANE INGA, SEPTEMBER 20-OCTOBER 14

Inga was first detected as a depression on the 20th near 16° N., 47° W. She reached tropical storm intensity early on the 21st, but was downgraded again on the 23d near 18° N., 56° W. As a depression, Inga moved west-northwestward until the 25th when she turned toward the north. It wasn't until the 28th that her circulation was able to regain tropical storm intensity near 24° N., 64° W.

Late on the 29th near 26° N., 65° W., Inga reached hurricane strength and turned northeastward. She moved to 230 mi. southeast of Bermuda where she slowed and began a clockwise loop on October 1. At this time maximum winds were 70 kt. around a 987-mb. pressure. The hurricane continued to intensify as she looped and went into a recurvature pattern on the 3d. Inga then headed northeastward on the 4th passing 150 mi. southeast of Bermuda this time. The following day she reached peak intensity when her central pressure dropped to 965 mb., and maximum winds reached 90 kt.

Inga was prevented from continuing her northeastward trek by a large HIGH to her north; consequently, she turned southward once again on the 8th. The storm was now starting to weaken as pressure rose to 985 mb., and winds were of minimal hurricane strength. On the 10th Inga was reduced to a tropical storm before crossing the 30th parallel on her unusual southward journey. However, cold air was beginning to intrude into Inga's weakening circulation. The storm turned toward the east on the 12th and became extratropical on the 14th, near a position she had passed once on the 30th and again on the 3d.

Inga's 25-day life makes her the longest lived recorded hurricane.

TROPICAL STORM JENNY, OCTOBER 1-6

Jenny reached minimal tropical storm strength for a few hours on the 2d, just prior to reaching the southwest Florida coast -- maximum winds reached 35 kt. and pressures dropped to 1001 mb. Some gusts to 48 kt. were reported as Jenny moved ashore near Naples.

Jenny had originated north of Panama and became a depression north of Swan Island on the 1st.

As a depression over Florida, Jenny moved north-northwestward until she reached Cape Kennedy on the 3d. Then half off the coast, she slowed and began to meander westward. This weak, ill-defined depression dumped 3 to 4 in. of rain over the Florida peninsula before moving into the Gulf of Mexico, off St. Petersburg, late on the 4th. She continued westward for the next 2 days before dissipating in the northwestern Gulf of Mexico.

HURRICANE KARA, OCTOBER 7-19

When Kara was discovered as a tropical depression east of the Bahamas on the 7th, it was no surprise since these waters have bred early October storms in the past. The depression moved through the eastern Bahamas, turned northward, and became a tropical storm on the 9th -- the first "K" storm since 1955. At this time Kara was near 28° N., 73° W. She began to slow down and turn toward the north-northwest on the 11th.

Early on the 12th Kara was drifting near 30° N., 71° W., and her winds were causing rough seas from northeast Florida to Cape Hatteras.

Kara's track became irregular for the next 2 days in an area where irregularity is common for October storms. She moved southwestward; then on the 13th and 14th she turned a small counterclockwise loop and finally headed east-northeastward. During this period Kara was intensifying slowly. Her central pressure remained at 998 mb. from the 10th through the 13th, and then dropped to 990 mb. by noon on the 14th when winds reached 55 kt. Later in the day pressure fell to 989 mb., winds reached 60 kt., and gales extended out to 160 mi. in all directions. The center was located about 250 mi. east-southeast of the Georgia coast. Early the next day Kara reached hurricane strength about 250 mi. south-southeast of Cape Hatteras. She was then accelerating on an east-northeasterly course. Kara's central pressure dropped to 984 mb. as she continued to generate 65-kt. winds close to her center. Pressures started rising on the 16th and then reversed this trend, and on the 17th Kara reached peak intensity; winds roared at 80 kt. around a 978-mb. central pressure. Kara was now moving east-northeastward at 35 kt. On the 18th the storm was deemed extratropical as she passed some 400 mi. north of the Azores.

HURRICANE LAURIE, OCTOBER 17-27

In late October, many tropical cyclones originate in the southwestern Caribbean and Gulf of Honduras. Laurie fitted this pattern when she was discovered as a tropical depression just off the northern Honduran coast on the 17th. The depression moved northwestward, entering the Yucatan Peninsula, south of Cozumel Island, on the 18th. Laurie reached tropical storm strength as she moved ashore. She moved off the coast just north of Merida. Once over the warm Gulf waters Laurie began to grow in size and intensity; and she rapidly became a threat to the U. S. Gulf Coast.

Laurie became a hurricane on the morning of the 20th about 300 mi. south of New Orleans. Gales extended 160 mi. to the north and 50 mi. to the southwest of the center. Laurie was moving northward at about 6 kt., and was in an area where about 85 percent of all tropical cyclones reach the U. S. coast. However, several blocking HIGHS from the north prevented Laurie from her statistical rendevous.

Late on the 20th, the hurricane reached its peak when pressure fell to 973 mb. and winds increased to 95 kt. It was at this point that Laurie changed her direction and began drifting slowly eastward; things looked gloomy for the west coast of Florida. Then Laurie turned southward and remained at sea. On the morning of the 22d, two vessels moved through the eye of the storm confirming its position and the central pressure which was now 985 mb.

Laurie was downgraded to a tropical storm near 25° N., 86° W., late on the 22d. At this time the storm was nearly stationary and in the process of turning westward. The storm moved westward and completed a clockwise loop late on the 24th; in the process she fell to depression stage as cold air was being injected into her system from the north. On the 25th the weak depression turned southward into the Bay of Campeche and the following day limped ashore just north of Villahermosa, Mexico. Laurie was the first hurricane in the Gulf of Mexico not to generate at least gale force winds along a coastline.

HURRICANE MARTHA, NOVEMBER 21-25

Martha developed from a large area of showers that had persisted over the southwestern Caribbean for several days. On the 21st a portion of the area became an organized tropical depression near San Andres Island. When the depression reached tropical storm strength the following afternoon, she became the latest tropical storm or hurricane to develop since hurricane Alice formed on December 30, 1954.

Martha rapidly reached hurricane strength and by 2000 EST on the 22d she was generating 74-kt. winds around a 986-mb. pressure. Martha became the latest hurricane to develop in the southwest Caribbean over the past century; the only other storm in this area during the latter half of November developed on Nov. 15, 1933. At the time Martha reached hurricane strength she was about 120 mi. northwest of Colon in the Canal Zone and was stationary. The following day the hurricane began drifting southwestward. Gales were occurring along the coast from Puerto Limon, Costa Rica, to the Gulf of Mosquitos along the Panama coast. She weakened as she drifted southward toward Panama, and became a tropical storm again late on the afternoon of the 23d.

Slowly the storm moved into the Gulf of Mosquitos and her heavy rains spilled inland. Then on the 24th Martha became the first tropical cyclone, in a 99-yr. period of record, to move into Panama when she crossed the coastline midway between Almirante and Colon. Torrential rains from the storm were measured at 13 in. by the United Fruit Company in Almirante with heavier rains to the southeast. Martha broke up slowly on the 24th. Rain-swollen rivers and streams caused numerous floods throughout the area. These floods were responsible for five deaths in Costa Rica.

TROPICAL CYCLONES IN THE EASTERN NORTH PACIFIC, 1969

Arthur F. Gustafson
Weather Bureau
Environmental Science Services Administration
San Francisco, California

Four hurricanes developed over the eastern North Pacific Ocean during the 1969 season. The strongest wind reported by a surface vessel was 58 kt. in Doreen, but inference from satellite pictures suggests 85-kt. winds were generated in Bernice. Six tropical storms with winds of 34 to 63 kt. formed during the season; the seasonal distribution of tropical cyclones is shown in the accompanying table.

The season began with a short-lived tropical depression (May 30-31) and another (June 4-8) before tropical storm Ava developed on July 1. The season continued until October 11 when hurricane Jennifer swept inland north of Mazatlan.

A total of 131 tropical storm and hurricane advisories and an additional 87 bulletins for tropical depressions were issued during the season.

Again in 1969, the satellite proved to be the most useful tool available in tracking storms. Three satellites were in operation during the season. They passed over the area during the early morning hours, during midmorning, and during midafternoon. A stationary satellite over the Equator near 150° W provided data for research but was not used for operational forecasts.

Merchant shipping provided much information at 1800 and 0000, but 0600 and 1200 observations were very sparse. This paucity of information and the lack of late day and night satellite pictures made it possible to lose storms overnight. Several times storms were relocated after 1600 or 1800 satellite pictures were received. In at least one case, a captain altered course on receipt of a 1500 advisory only to have the storm relocated a few hours later. This required him to pass through, instead of around, the storm.

U. S. Air Force and U. S. Navy reconnaissance was accomplished whenever a storm was within aircraft range, or a total of 28 times. For the first time since World War II, aircraft were permitted to re-stage from Acapulco. This greatly increased the reconnaissance range. An aircraft would locate the storm one day and fly on to Acapulco, remaining overnight. It would then leave the following morning, locate the storm, and return to Point Mugu. This proved valuable because the same crew would see the storm two days running and could make relative estimates of its intensity.

Damage was reported only in the case of hurricane Jennifer, and that only near Mazatlan. The La Paz-Mazatlan ferry was swamped in the Mazatlan Harbor, as were 12 shrimp boats. More than 30 other shrimp boats were reported lost in smaller harbors along the coast. At least one person was killed and 15 were injured. Extensive property damage extended along a 100-mi. section of the coast.

TROPICAL STORM AVA, JULY 1-7

A bright cloud mass in satellite pictures on June 30 off the coast of Guatemala developed a closed circulation between 1200 and 1800 on July 1. The depression moved west-northwestward at 15 kt. and developed to tropical storm intensity about 150 mi. south-southeast of Acapulco. It developed 40-kt. winds by 0200 of the 2d.

Winds increased to 55 kt. as the storm continued on a 280°-290° heading at an average speed of 12 kt. through the 4th. At 0000 on the 5th the storm began curving northwestward while weakening, and then slowed down to 5-6 kt. 150 mi. south of Socorro Island. Further weakening and slowing took place on the 6th as the storm headed northward. It degenerated to a depression 60 mi. west of Socorro Island at 0000 on the 7th. Advisories were discontinued when the depression lost its identity near 20° N., 112° W., at 1800 on the 7th.

HURRICANE BERNICE, JULY 8-16

A tropical depression formed in an area of showers and squalls about 400 mi. southwest of Acapulco between the 8th and 9th as indicated by ship reports and later verified by satellite pictures. From its point of development, or through a process of redevelopment, the center of activity moved southwestward to near 11° N., 106° W., at 0000 on the 10th. It then began moving northwestward at 8 kt. The disturbance was identified as a tropical storm with maximum winds of 40 kt. at 1800 on the 10th. The storm continued on about a 300° heading with winds increasing to hurricane intensity at 1800 on the 12th near 14° N., 112° W.

Hurricane winds continued through the night of the 13th with highest speeds of 85 kt. indicated by satellite pictures at 2110 on the 12th. At 1733 on the 14th, satellite pictures indicated that weakening had begun and Bernice was downgraded to a tropical storm near 18.5° N., 123.0° W.

Further downgrading to a westerly moving depression took place at 0000 on the 16th. Twenty-four hours later no further trace of the disturbance remained.

TROPICAL STORM CLAUDIA, JULY 21-23

A tropical depression was identified in a satellite picture at 1747 July 21 near 13° N., 130° W., or far from normal shipping lanes. The depression was moving northwestward at 12 kt. It was identified as tropical storm Claudia in pictures later that day. The storm continued moving northwestward at 12 kt. through 0000 of the 23d. It weakened to a tropical depression near 16° N., 135° W., while moving west-southwestward.

The depression continued weakening and entered the easterlies as a wave near 140° W. at 1800 on the 23d.

HURRICANE DOREEN, AUGUST 4-9

A large cloud mass visible on satellite pictures in an area devoid of ship reports on August 3 suggested a tropical storm was developing near 16° N., 107° W. At 1620 on the 4th, it was apparent that a closed circulation had developed, and photographs and 1800 ship reports indicated that the maximum winds were up to 50 kt. The center was near 17.0° N., 107.5° W., and it was moving northwestward at 8 kt.

The storm intensified to a hurricane, with 75-kt. winds on the 5th, about 100 mi. east of Socorro Island. It remained at that intensity through the evening of the 5th when a gradual weakening was indicated by U. S. Air Force reconnaissance of the storm. By 0000 on the 7th, Doreen was downgraded to a tropical storm near 17.5° N., 117.0° W. Maximum winds were 45 kt., and it was moving west-northwestward at 10 kt. Doreen became a westward-moving tropical depression 24 hrs. later. She was last seen as a weak disturbance in satellite pictures on the 8th, but was no longer visible on the 9th.

TROPICAL STORM EMILY, AUGUST 22-24

Ship reports at 1400 on the 22d indicated a tropical

storm at 18.6° N., 104.4° W. in an area of squalls that extended 600 mi. off the Guatemalan and Mexican coasts as far north as Manzanillo.

The storm moved northwestward at 12 kt. with 50- to 55-kt. winds through the 23d to a point 120 mi. west of Cape San Lucas, Baja California. It then became a tropical depression while moving west-northwestward, but it weakened during the night of the 23d. By 1800 on the 24th, the depression could no longer be identified on weather maps or in satellite pictures.

TROPICAL STORM FLORENCE, SEPTEMBER 2-7

A squally low-pressure area developed during the latter part of August off the coast of Mexico from the Gulf of Tehuantepec to west of Manzanillo. A tropical depression formed about 200 mi. southwest of Manzanillo at 0000 on September 2. The depression moved west-northwestward at 7 kt. through that night and then curved north-northwestward on the 3d. It became nearly stationary and apparently made a loop near 20.5° N., 109.5° W. on the 4th, after becoming a tropical storm and developing winds of 60 kt. at 1800 on the 3d. The storm left the loop at 0600 on the 5th and moved northward at 5 kt. It accelerated to 8 kt. on the 6th and passed 60 mi. west of Puerto Cortez, Baja California.

Dissipation was rapid, and by 0600 on the 7th, it was apparent that winds were not abnormal west and southwest of Puerto Cortez. Cyclonic cloud patterns continued in satellite pictures until 1800 on the 8th, after which no trace of the depression could be found.

HURRICANE GLENDA, SEPTEMBER 7-12

A low-pressure area southeast of Acapulco at 0000 on September 7 developed a closed circulation, and by 2250 it had developed into tropical storm Glenda on the basis of ship reports. The center of the storm was about 120 mi. south of Acapulco and was moving northwestward at 6 kt. with maximum winds of 40 kt. near the center.

The storm gradually increased its northwestward movement to 10-12 kt. by 1800 on the 9th. Wind speeds increased to 50 kt. by 1200 on the 8th and 50-60 kt. by 1800 on the 9th. The storm became a hurricane, under Air Force reconnaissance, between 0000 and 0600 on the 10th, 180 mi. southwest of Mazatlan.

Dissipation was gradual and was documented by aircraft reconnaissance, ship reports, and satellite observations. The storm moved to within 120 mi. of Magdalena Bay, Baja California, with 45-kt. winds. It then turned west-northwestward and was last observed by Navy reconnaissance during the afternoon of the 11th. Dissipation at 0600 on the 12th was near 26° N., 118° W.

TROPICAL STORM HEATHER, SEPTEMBER 18-25

Tropical storm Heather developed in a data-sparse area about 1,000 mi. southwest of La Paz, Baja California, on September 18; it was first located through satellite pictures.

From its area of development near 14.5° N., 122.0° W. on the 18th, the storm moved west-northwestward. Maximum winds of 45 kt. increased to 55 kt. by 1800 on the 19th, near 15.0° N., 124.5° W. These winds then began weakening as the storm moved very slowly in a more northwesterly direction. It became a tropical depression at 0000 on the 22d near 17° N., 129° W. The depression accelerated northwestward through the 24th and then turned westward. Satellite pictures at 1800 on the 25th suggested the depression had dissipated near 21° N., 137° W., during the night of the 24th and morning of the 25th.

TROPICAL STORM IRAH,
SEPTEMBER 29-OCTOBER 3

A number of intense squalls along the coast of Mexico developed during late September and early October with locally strong winds and possible waterspouts, but with no organized circulations that could be identified.

A depression formed about 175 mi. south of Socorro Island during the afternoon of the 29th. By 0600 of the 30th, unidentified ship reports indicated the depression became a tropical storm while moving on a 280° course at 5-6 kt., 150 mi. southeast of Clarion Island. Winds remained at 35 kt. through the 1st when the storm recurved eastward while becoming a tropical depression 60 mi. south of Clarion Island. It dissipated in an area of squalls 100 mi. southeast of the island by 1800 on the 3d.

HURRICANE JENNIFER, OCTOBER 8-12

Hurricane Jennifer developed about 250 mi. southwest of Acapulco. It was first seen in a 1600 satellite picture of October 8. A special advisory was issued for a tropical storm moving westward at 10 kt. with maximum winds of 50 kt. Later observations indicated a more northwestward movement. The storm intensified to 55 kt. at 0600 on the 9th and to hurricane intensity, with 65-kt. winds, 12 hrs. later about 250 mi. southwest of Manzanillo.

The hurricane curved northward, slowing to 7 or 8 kt. on the 10th. It then turned northeastward while accelerating to 15 kt. Jennifer reached the coast of Mexico 40 mi. north of Mazatlan during the afternoon of the 12th with 70-kt. winds. It then dissipated rapidly as it moved inland.

TYPHOONS OF THE WESTERN NORTH PACIFIC, 1969

Richard M. DeAngelis*
Environmental Data Service
Environmental Science Services Administration
Washington, D. C.

This season was marked by the small number of tropical cyclones that roamed the western North Pacific. Not since 1954 have less than 20 tropical cyclones developed in these waters. This year 19 tropical cyclones formed and just 13 reached typhoon strength -- the lowest typhoon total since 1950. Tables 1 and 2 contain the statistics on the storms for past years.

Of the 13 typhoons this season, two reached super-typhoon strength (wind $\geq$ 130 kt.) -- Viola and Elsie. Elsie was the largest, most destructive, and farthest traveled storm of the season. The season itself stretched from mid-January to late December with peak activity in August.

In the following narrative typhoon summary and in the accompanying figures, intensities are classified by wind speeds as follows:

typhoon	64 kt. or more
tropical storm	34-63 kt.
tropical depression	less than 34 kt.

Dates for individual tropical cyclones indicate the periods during which warnings were issued. Storm tracks and maximum winds are based on post storm analysis.

PHYLLIS, JANUARY 17-22

The first typhoon of the season developed from the first depression of the year. The tropical disturbance was discovered just east of the Marshall Islands. On the 17th, north of Majuro, it became an organized tropical storm. The tropical storm developed rapidly and reached typhoon strength late in the day. The following day Phyllis reached peak strength as she moved west-northwestward through the Marshall Islands. Central pressure dropped to 966 mb. and surface winds increased to 85 kt. near the center of a circulation which covered an area about 480 mi. in diameter.

Phyllis began to slow down as she neared the Marianas. On the 20th, about 300 mi. east-southeast of Saipan, Phyllis looped and headed westward. During the loop she fell to tropical storm intensity. On the 22d, sporting 35-kt. winds, Phyllis moved over Guam. Later that day, the year's first typhoon called it quits.

SUSAN, APRIL 18-25

After two quiet months, the tropical North Pacific gave birth to its second typhoon of the year. Susan was the first to make landfall when she moved into the Philippines just north of Mindanao late on the 23d.

Susan was initially discovered just south of the Caroline Island Chain. She became an organized depression about 300 mi. east of Koror on the 18th and a tropical storm as she passed over Koror on the 19th. Susan crossed the 130th meridian as a full-blown typhoon on the 21st. She turned toward the west-northwest and continued to deepen. By early the next day, she reached peak intensity as 105-kt. winds roared around the center of her 240-mi. radius circulation. Susan had reached her lowest central pressure of 943 mb. the day before. Since she was just 120 mi. from land, the Philippines were already feeling the sting of her winds. As Susan approached the Islands, she slowed and weakened. On the 23d, she became stationary between Dinagat and Siargao Islands. From this vantage point she slowly beat herself to death against the rugged islands of Mindanao and Leyte.

TESS, JULY 8-11

Once again two months passed without any typhoon activity in the western North Pacific. Then on the 7th of July, a weak tropical disturbance drifted across the central Philippines. On the 8th, the disturbance organized into a depression in the Mindoro Strait. It was in this area that the 3,805-ton Liberian ship HONG KONG PIONEER struck a reef and was grounded. The vessel was later refloated and towed to Manila.

On a west-northwestward heading, Tess reached typhoon strength about 360 mi. west of Manila late on the 9th. A few hours later, she reached peak intensity as winds climbed to 70 kt. around a 974-mb. center. Tess began to weaken as she continued west-northwestward. On the 11th, she dissipated near Hue, South Vietnam.

VIOLA, JULY 21-28

Just 10 days after the demise of typhoon Tess, Viola began churning western North Pacific waters. Actually, a tropical disturbance was spotted just south of the Caroline Islands on the 20th. The following day, the disturbance organized into a tropical storm as it moved northwestward through the eastern part of the island chain. These events marked the beginning of the season's first supertyphoon.

Viola reached typhoon strength on the 23d and after crossing the 15th parallel maximum winds passed the 85-kt. mark and central pressure fell to 952 mb. At this point, Viola turned toward the west-northwest. She intensified rapidly during the next 2 days. This was attested to by the LAFAYETTE VICTORY which encountered 26-ft. seas 100 mi. northeast of the storm's center on the 24th and by the HELEN which was raked by 60-kt. winds some 225 mi. northeast of the center on the 25th. Shortly after HELEN's encounter, Viola reached super-typhoon strength. She was now about 230 mi. east of Luzon; winds near her center were estimated at 130 kt. while central pressure, which had not reached its lowest point, was measured at 900 mb. and falling. Viola's circulation was so large at this point that it extended into the South China Sea and covered a good portion of the Philippines.

As Viola edged toward land maximum winds began to diminish. On the 26th, she moved into the Taiwan Strait with a good portion of her circulation over Taiwan to the north and the Philippines to the south. Her winds battered both areas and caused at least 20 deaths. Seven persons drowned when their boat capsized in central Philippine waters. Torrential rains caused a landslide at the mountain resort of Baguio, Philippines, and flash flooding at Manila. It was during this period that Viola reached her lowest pressure -- 897 mb.

By the 27th, winds fell to 100 kt. and Viola was approaching the China coast. The storm was still potent though; the PRESIDENT LINCOLN, some 300 mi. east-northeast of the center, encountered 30-ft. swells. A short time later the storm crossed the China coast near Chaoan.

BETTY, AUGUST 5-8

Betty, like Viola, was first detected near the Caroline

*Based on information furnished by the Joint Typhoon Warning Center, Fleet Weather Central, Guam, Mariana Islands.

Islands. On the 3d, she was picked up as a weak disturbance 300 mi. south-southwest of Guam. By the 5th, she was an organized tropical storm cavorting in the waters 450 mi. west of Guam. Tropical storm Betty moved toward the northwest at 18-20 kt. She didn't attain typhoon intensity until nearing Taiwan on the 7th. Betty reached full strength early the following day as she brushed the northern Taiwan coast; winds climbed to 70 kt. around a 962-mb. center. Some 200 mi. east of the center the OCALA VICTORY encountered 26-ft. swells and 40-kt. winds. The typhoon moved inland near Fu-chou on the mainland.

CORA, AUGUST 14-23

A third straight typhoon-generating disturbance was found lurking among the Caroline Islands on the 12th. By the 14th, it was a tropical depression 240 mi. southwest of Guam. Less than 24 hrs. later, tropical storm Cora was christened. By the 16th, she was generating 45-kt. winds around a 990-mb. center and the LAREDO VICTORY encountered 45-kt. gales some 140 mi. east-southeast of the cyclone.

Cora was moving northwestward but began to recurve on the 18th about the time she reached typhoon strength near 22° N., 129° E. She reached her peak on the 19th just south of Okinawa; winds climbed to 85 kt. around a 948-mb. pressure center. She then passed just west of the island and blasted it with winds and rain. No deaths, but five injuries, were reported. Sugarcane and other crops were damaged, electrical service was curtailed and telephone service was interrupted. Signs and windows were badly damaged and flooding was prevalent over much of the island.

Once into the East China Sea, Cora turned northward, then northeastward. She crossed southern Kyushu early on the 22d and at that point fell to tropical storm intensity. As a tropical storm, she brushed southeastern Shikoku and moved inland over Honshu late on the 22d. Cora was generating less than 40-kt. winds near her center as she moved over the rugged terrain west of Tokyo on the 23d. However, the SAN JUAN EXPORTER on the southwest fringe of the storm's circulation reported 40-kt. winds and 23-ft. seas. She was also potent enough to cause damage in southern Honshu and was responsible for at least 1 death and 87 injuries. Cora moved back to sea later on the 23d and turned extratropical.

DORIS, AUGUST 31-SEPTEMBER 2

The tropical disturbance which gave rise to Doris was first detected in the central Philippines on the 30th. The following day she became a tropical storm about 250 mi. west of Manila. Doris continued her west-northwesterly trek until late on the 31st when, in the middle of the South China Sea, she turned toward the west.

On the 1st, about 100 mi. south of Hainan, Doris reached minimal typhoon strength as winds reached 65 kt. around a 973-mb. pressure. Before the day was out, the typhoon was approaching Dong Hoi on the coast of South Vietnam. The following day, as a tropical storm, Doris moved inland and dissipated.

ELSIE, SEPTEMBER 19-27

On the 17th, some 300 mi. south of Wake, the engines began to turn and what was to be the year's biggest typhoon began an 11-day, 3,000-mi. run to mainland China with a stopover at Taiwan. Like a big train Elsie's momentum slowly grew. On the 19th, she reached depression stage, by early on the 20th she was a tropical storm, and later in the day typhoon Elsie was under a full head of steam. Chugging west-northwestward, she passed 150 mi. north of Saipan on the 22d doing 17 kt.

Early on the 23d, Elsie was generating 135-kt. winds around a 900-mb. pressure center and still building. By 1200 the winds were up to 140 kt. and by 2300 winds were raging at 145 kt. around an 896-mb. pressure. Elsie reached her peak on the 23d. The huge storm generated winds of 150 kt. and a pressure of 890 mb. Her center was still 800 mi. from Taiwan, but the outer edges of her circulation were only 200 mi. away.

Elsie rolled on. However, as she approached land she started to slow down and lose steam. She arrived in Taiwan on the 26th carrying 100-kt. winds close to her center. She roared across the northern part of the island and both Elsie and Taiwan suffered. Elsie's winds dropped to 75 kt., and after a brief passage over the Taiwan Strait her journey came to an end in mainland China.

The island suffered a disaster and the damage was mostly from the wind. Agricultural areas in central Taiwan suffered heavy crop losses. At least 50 persons were killed and 40 were injured. About 90 percent of Taipei's residents were without drinking water or electricity and 600 or more houses were destroyed on various parts of the island. One week later, tropical storm Flossie brushed Taiwan causing flooding over the central part of the island. Crop losses from both storms are estimated between $10 and $15 million.

Among the ship casualties from Elsie was the 4,185-ton Korean vessel YOUNG POONG which, while sheltering in Kanokawa Bay, dragged her anchors and ran aground at Iriomote Island in the Ryukyus.

GRACE, SEPTEMBER 29-OCTOBER 6

The tropical disturbance which was to spawn Grace developed at a very high latitude -- near 24° N. She headed eastward, then as a tropical storm late on the 29th turned toward the northeast. However, after crossing the 165th meridian near 27° N., Grace began to turn around and in the process became a typhoon. After a 180° reversal she made things even more complicated by turning a counter-clockwise loop on the 1st. By late on the 1st, she had finally made up her mind and was romping toward the west-southwest. Winds were continuing to increase and the central pressure had dipped to 967 mb.

On the 3d, Grace began to swing toward the west-northwest as winds increased to 90 kt. On the 4th, she turned northwestward and also reached peak intensity; winds increased to 95 kt. The pressure had reached a minimum of 937 mb. at 2130 on the 3d as Grace moved just north of Marcus Island. Grace turned toward the northeast early on the 5th, shortly after crossing the 150th meridian. By this time, winds were diminishing and the storm was beginning to turn extratropical. On the 6th, winds dropped from 65 kt. to 45 kt. as the storm headed northeastward. On the 7th, as an extratropical storm, Grace was encountered by several ships. The USCGC CHAUTAUQUA, about 140 mi. east-southeast of the storm's center

encountered 50-kt. winds while at the same time in the same area the ZOELLA LYKES measured southeasterly winds at 55 kt.

HELEN, OCTOBER 8-12

Like so many storms this season, Helen originated from a disturbance in the Caroline Island Chain. Early on the 8th, a reconnaissance crew found the disturbance had become an organized tropical storm near 15° N., 151° E. Helen moved west-northwestward until she reached 20° N. near 143° E. on the 10th. A few hours earlier she had become a typhoon.

On the 10th, the typhoon began the familiar recurvature pattern while continuing to intensify. She reached peak intensity between Iwo Jima and Chichi Jima on the 11th. At that time 105-kt. winds encompassed a 930-mb. pressure center. Helen passed just to the east of the two islands as she swung northeastward. As she moved into the northern latitudes her intensity began to diminish while her speed accelerated rapidly. By the 12th, Helen's forward speed had reached 40 kt. as she headed east-northeastward. Colder air was intruding into her circulation, and by late on the 12th Helen was an extratropical storm generating 45-kt. winds near 39° N., 165° E.

IDA, OCTOBER 15-22

Ida was almost a repetition of Helen which had formed just 1 week earlier. The disturbance that was to spawn the 11th typhoon of the season was discovered on the 13th just 300 mi. west of last week's disturbance. By the 15th, the disturbance was just south of Saipan and had the characteristics on radar of an organized tropical storm. A short time later, reconnaissance indicated 35-kt. winds and a 1005-mb. pressure.

Ida reached typhoon strength on the 17th near 18° N., 145° E. At this time she was on a north-northeasterly track. Later in the day the central pressure fell to 917 mb. -- lowest in the storm's history. However, Ida's maximum winds did not reach a peak until the 20th when they climbed to 115 kt. By this time the central pressure had already climbed above 930 mb. and Ida had crossed the 25th parallel. As cold air intruded, winds diminished rapidly and by the 22d, Ida had become an extratropical storm generating 55-kt. winds near 32° N., 157° E.

JUNE, OCTOBER 28-NOVEMBER 5

A disturbance was detected about 180 mi. west of Yap Island on the 26th. On the 28th, about 320 mi. east of Yap, it became a depression and by the 29th, it was June in October as the tropical storm meandered northward. June reached typhoon strength the following day as winds reached 75 kt. around a 973-mb. center.

June continued her northward trek paralleling the Philippines and then turned northeastward and paralled Japan. It was on the 2d of November, as she crossed the 20th parallel, that June reached peak intensity. Her winds were measured at 105 kt. around a 936-mb. pressure. June retained 100-kt. winds from early on the 2d to early on the 4th. By early on the 5th winds had dropped below hurricane force and the intrusion of cold air had turned June extratropical.

KATHY, NOVEMBER 3-8

The last typhoon of the season traversed a 2,040-mi. arc from near Truk Island to east of the northern Ryukyus. Kathy reached tropical storm strength on the 3d about 200 mi. west-northwest of Truk, and became a typhoon on the 4th when winds were measured at 75 kt. around a 968-mb. pressure center. Kathy hovered around minimal typhoon intensity until the 6th when she began to intensify. Central pressures dropped from 984 mb. early on the 6th to 930 mb. by late on the 7th; winds during this period rose from 80 kt. to a peak of 110 kt. shortly before Kathy crossed the 20th parallel. Cold air began filtering into the typhoon and winds fell to below 80 kt. as she turned extratropical late on the 8th.

GENERAL SUMMARY OF FLOOD LOSSES FOR 1968

Elmer R. Nelson and Raymond J. Haley
Office of Hydrology, Weather Bureau

Monetary losses from floods in the United States during 1968, estimated at nearly $350 million, were $25 million less than in 1967. Flood losses during 1968 were 43% of the total damages in 1965 when it totalled $785 million and 85% of the 15-year (1951 to 1965) national average of $400 million (adjusted to the 1965 price index). Destructive overflows have caused property damage in some years estimated at more than $1 billion.

Total loss of life in 1968 from floods was 31 compared to 34 in 1967 and 119 in 1965. This is the second lowest loss of life since 1962, when 19 lives were lost.

The most disastrous floods in the United States during 1968 occurred in northern and east-central New Jersey during May. This was the worst flooding in northern New Jersey since 1936 and in some sections since 1903. Estimates of flood damage were placed at $166.7 million and the loss of life at eight. Flood losses in this area equalled nearly 50% of the total damages in the United States during 1968.

Damaging floods occurred in southeastern New England during March. Severe flash flooding occurred along most of the smaller rivers and streams in eastern Massachusetts and Rhode Island. Practically every town in eastern Massachusetts, from about Worcester east, and most of Rhode Island reported moderate to severe flash flooding of small streams and brooks. Record to moderate flooding occurred on many streams in southeastern New England. Estimates of flood losses by the Corps of Engineers were placed at $45 million. Two lives were lost in the town of Lee, Mass.

The savings resulting from ESSA, Weather Bureau River Forecasting Service in 1968 were estimated at $35 million. The average annual savings, based on fragmentary information, during the 15-year period 1951 to 1965 is approximately $50 million.

ANNUAL FLOOD LOSSES FOR UNITED STATES

Annual Flood Losses and Savings for years 1933 to 1947, inclusive, have been published in the Monthly Weather Review as follows:

Year	Issue	Pages
1933	Vol. 62, No. 1, Jan. 1934	25-27
1934	Vol. 62, No. 12, Dec. 1934	465-467
1935	Vol. 63, No. 12, Dec. 1935	362-365
1936	Vol. 65, No. 1, Jan. 1937	28-31
1937	Vol. 66, No. 12, Dec. 1938	426-430
1938	Vol. 68, No. 9, Sept. 1940	262-263
1939	Vol. 68, No. 11, Nov. 1940	329-330
1940	Vol. 69, No. 7, July 1941	217-218
1941	Vol. 71, No. 11, Nov. 1943	185-186
1942 & 1943	Vol. 73, No. 8, Aug. 1945	137-139
1944 & 1945	Vol. 76, No. 6, June 1948	113-116
1946	Vol. 76, No. 9, Sept. 1948	208-210
1947	Vol. 77, No. 9, Sept. 1949	262-265

Beginning with flood losses for the year 1948, annual flood loss data are published in Climatological Data National Summary as follows:

Year	Issue	Year	Issue
1948	August 1950	1959	Annual 1960
1949	Annual 1950	1960	Annual 1961
1950-1951	Annual 1951	1961	Annual 1962
1952	Annual 1952	1962	Annual 1963
1953	Annual 1953	1963	Annual 1964
1954	Annual 1955	1964	Annual 1965
1955	Annual 1956	1965	Annual 1966
1956	Annual 1957	1966	Annual 1967
1957	Annual 1958	1967	Annual 1968
1958	Annual 1959		

Prior to 1933 Flood Losses and Savings were published monthly, as a rule, in the Monthly Weather Review.

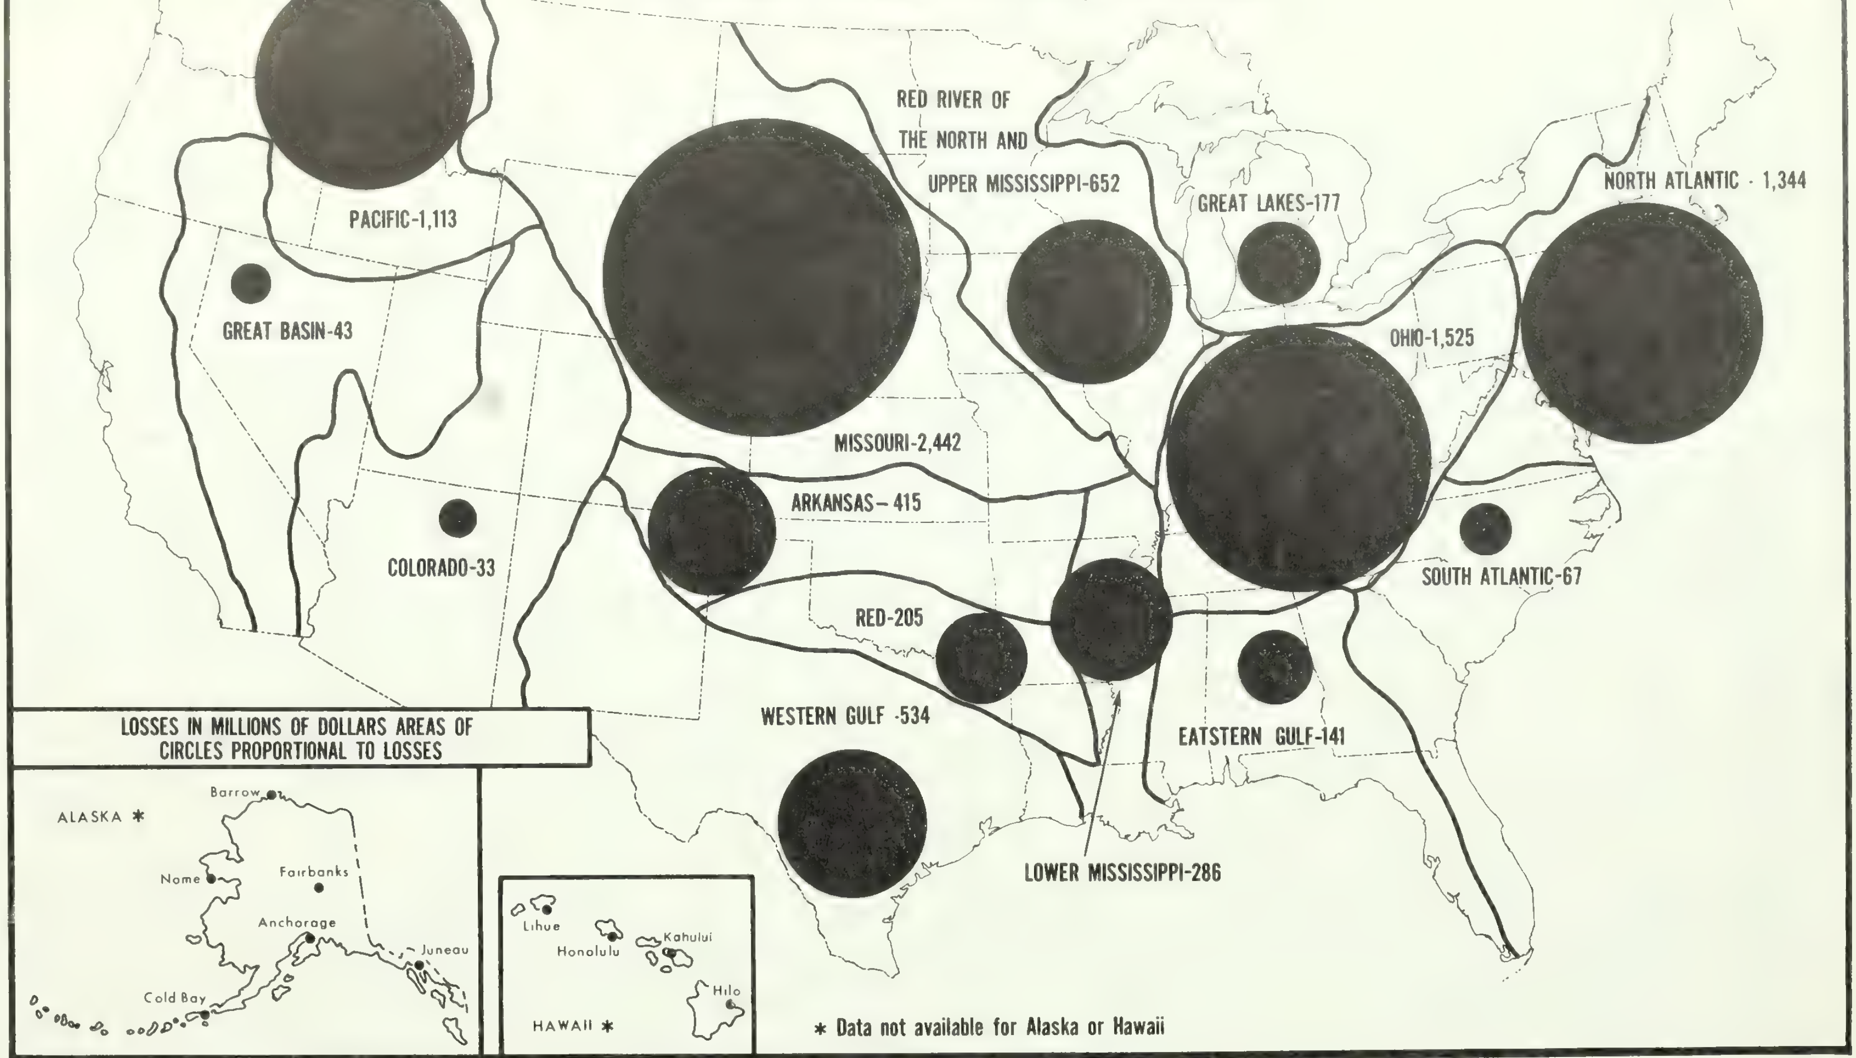
DISTRIBUTION OF ESTIMATED FLOOD LOSSES IN THE UNITED STATES BY MAJOR RIVER SYSTEMS, 1925-1968



WEA 103G

USCOMM ESSA-DC

LOSSES IN INDIVIDUAL SEVERE FLOODS IN THE UNITED STATES SINCE JULY 1902

Property Losses in Thousands of Dollars

Date	Location	Lives #	Property
May-June 1903------	Kansas, Lower Missouri, and Upper Mississippi Rivers-----------------------	100	$ 40,000
July 1908----------	Red River-----------------------------------	---	16,200
March 1912---------	Lower Mississippi River-------------------	---	70,000
March 1913---------	Ohio River and tributaries-----------------	467	147,000
December 1913------	Texas rivers--------------------------------	177	9,000
June 1915----------	Kansas River--------------------------------	---	5,950
August 1916--------	Rivers of the Carolinas--------------------	---	21,700
June 1921----------	Arkansas River in State of Colorado--------	120	25,000
September 1921-----	Texas rivers--------------------------------	215	19,000
October 1923-------	Lower Arkansas, including the State of Oklahoma----------------------------	---	15,000
March 1924---------	Potomac River-------------------------------	---	6,000
Spring of 1927-----	Mississippi Valley-------------------------	313	284,118
November 1927------	New England rivers-------------------------	88	45,578
December 1933------	Columbia River and tributaries-------------	---	10,000
May 1935-----------	Rivers in eastern Colorado-----------------	---	6,000
May-June 1935------	Republican and Kansas Rivers---------------	110	18,000
	Lower Missouri River-----------------------	---	10,000
July 1935----------	Upper Susquehanna tributaries--------------	52	26,000
December 1935------	Houston, Texas area------------------------	---	2,500
March-April 1936---	Rivers in eastern United States------------	107	270,000
Jan.-Feb. 1937-----	Ohio and lower Mississippi River basins----	137	417,685
December 1937------	Sacramento Valley--------------------------	---	7,100
March 1938---------	Streams in southern California-------------	79	24,500
September 1938-----	Rivers in New England----------------------	---	37,000
July 1939----------	Licking and Kentucky Rivers----------------	78	1,715
Feb.-Mar. 1940-----	Sacramento Valley--------------------------	---	6,700
August 1940--------	Rivers in southern Virginia, the Carolinas, and eastern Tennessee-------------------	40	12,000
Oct.-Nov. 1941-----	Arkansas River basin-----------------------	---	8,500
April-June 1942----	Upper Mississippi, Missouri, Arkansas, Red, and Trinity River basins-----------------	---	44,350
May 1942-----------	Delaware & Susquehanna River basins--------	33	13,000
July 1942----------	Upper Allegheny River and Sennemahoning Creek basins---------------------------	15	10,000
Nov.-Dec. 1942-----	Willamette River---------------------------	10	6,900
Dec. 1942-Jan. 1943	Ohio River----------------------------------	---	10,540
Apr.-June 1943-----	Maumee, Wabash, upper Mississippi, Missouri, White, and Arkansas River basins----------------------------------	60	172,500
August 1943--------	Little Kanawha------------------------------	23	1,300
April-June 1944----	Upper Mississippi, Missouri, Arkansas, Red, lower Mississippi Basins and east Texas Streams---------------------------------	17	82,000
Feb.-Mar. 1945-----	Ohio River----------------------------------	18	30,000
Feb.-Apr. 1945-----	Trinity and Sabine Rivers------------------	---	9,000
Mar.-July 1945-----	Lower Mississippi River--------------------	---	9,500
July 1945----------	Lake Section of Rensselaer County, N. Y.---	---	3,500
December 1945------	Willamette River---------------------------	---	6,000
January 1946-------	Cumberland River---------------------------	---	3,925
September 1946-----	San Antonio and Nueces Rivers--------------	---	6,050
December 1946------	Willamette River---------------------------	---	5,525
April 1947---------	Allegheny-----------------------------------	---	4,319
May-July 1947------	Rivers in middle West in the lower Missouri and middle Mississippi River basins------	29	235,000
June 1947----------	East Creek at Rutland, Vt.-----------------	---	2,000
Apr.-May 1948------	Red River of North and tributaries---------	---	18,700
May-June 1948------	[1]Columbia Basin--------------------------	35	101,725
June-July 1948-----	Arkansas River and minor tributaries-------	---	14,500
December 1948------	Housatonic River---------------------------	---	4,200
May 1949-----------	Trinity River------------------------------	10	14,000
June 1949----------	Shenandoah and Potomac Rivers--------------	11	8,850
Apr.-May 1950------	[2]Red River of North----------------------	---	33,000
June 1950----------	Central West Virginia----------------------	31	4,020
Nov.-Dec. 1950-----	Central Valleys of California and western Nevada--------------------------	---	23,000

Property Losses in Thousands of Dollars

Date	Location	Lives #	Property
April 1951	Upper Mississippi Basin	---	$ 18,622
June-July 1951	[3]Kansas-Missouri	28	923,224
April 1952	[4]Red River of the North-upper Mississippi-Missouri River basins	11	198,000
May 1952	Great Basin	---	8,373
March 1953	New England States	---	10,000
Apr.-May 1953	Louisiana-Texas	12	38,959
June 1953	Northwestern Iowa	14	32,950
June 1954	Middle Rio Grande and lower Pecos	16	19,079
October 1954	Pecos River in New Mexico	13	1,783
March 1955	Ohio Basin	15	14,396
August 1955	[5]Hurricane floods in Northeast	187	714,079
December 1955	[6]West Coast	61	154,532
May-June 1956	[7]Columbia and Kootenai Rivers	---	14,025
Jan.-Feb. 1957	[8]Streams in southeastern Kentucky, southwestern West Virginia, adjoining portions of Tennessee and Virginia	14	58,000
February 1957	Snake River and tributaries	---	20,500
Apr.-June 1957	Streams in Texas, Arkansas, Kansas, Louisiana, Missouri and Oklahoma	18	105,000
June-July 1957	Wabash River and tributaries	---	63,000
June 1958	White and Wabash Rivers	---	57,000
July 1958	Flash flood on East Nishnabotna River in Iowa	19	5,850
January 1959	Ohio River basin	---	81,921
January 1959	Lake Erie drainage in Ohio and New York	---	11,265
Mar.-Apr. 1960	[9]Snowmelt floods in the Missouri and upper Mississippi Basins	---	34,466
Feb.-Mar. 1961	East Gulf of Mexico drainage	---	13,997
July 1961	Flash flood on small streams in Charleston, W. Va.	22	3,238
September 1961	Kansas-Missouri	---	23,557
Feb.-Mar. 1962	Kentucky	---	16,067
Feb.-Mar. 1962	Southeastern Idaho	---	6,318
March 1963	Ohio River basin	26	97,600
June 1964	Montana	31	54,279
December 1964	California and Oregon	40	415,832
March 1964	Ohio River basin	13	81,602
Mar.-May 1965	[10]Upper Mississippi, Missouri, and Red of North Basins	16	181,325
May 1965	Brazos River	---	30,802
June 1965	South Platte Basin	16	415,076
June 1965	Sanderson, Texas flash flood	26	2,715
June 1965	Arkansas Basin	16	58,340
January 1966	Streams in Humboldt County, Calif.	---	6,850
Apr.-May 1966	Sabine and Trinity Basins, Texas	14	20,100
December 1966	Tulare and Buena Vista Lakes drainages in California	---	11,712
June 1967	Platte River and tributaries in Nebraska	---	35,275
September 1967	Hurricane "Beulah" floods in Texas	---	98,239
August 1967	Tanana and Chena Rivers in Alaska	---	98,550
March 1968	Rivers in New England (except Maine)	---	45,000
May 1968	Rivers in northern New Jersey	---	166,690

Loss of life carried only where ten or more.

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

Year 1969

Elmer R. Nelson, Office of Hydrology

There were several major damaging floods in the United States during 1969. Based on preliminary estimates of flood damage, the four most catastrophic floods during 1969 were as follows:

	Location	Month	Total Damages	Loss of Life
1.	Southern California	January	$170 million	47
2.	Red River of the North, Upper Mississippi, and Missouri Basins	March - April	$151 million	9
3.	Northern Ohio	July	$70 to $140 million	30
4.	Hurricane Camille floods in Virginia	August	$140 million	151

This report contains a brief summary, by months, of the most significant flooding during 1969. A detailed summary of flooding during 1969 appears in the monthly issue of this publication.

January

The most damaging floods during January occurred in southern California. These floods were generally the most severe since 1938. The flooding on the Salinas River was the most severe since 1952. Major damages occurred on the Chowchilla and Fresno Rivers and along streams running into the Valley from the foothill areas. Property damage from flooding and mudslides was estimated at about $170 million. The American Red Cross reported that a total of 47 lives were lost in California during January due to floods, mudslides, and snowstorms. The President allocated $108 million to the State for relief and restoration activities, making the disaster the most costly in the history of the U. S. Major Disaster Program.

February

The most damaging floods during February occurred in southern California for the second consecutive month. In most areas the flood damage was less than in the previous month. Mudslides were more numerous than in January. Channel flows were generally below the January level. Flooding in the Salinas Basin was more severe than in January which was the most severe since 1952. The Chowchilla and Fresno Rivers crested higher than in January. Major damage in the San Joaquin Basin was confined to the Valley floor and in the lower foothill areas.

The crests on the Wabash River from LaFayette, Ind., to Mt. Carmel, Ill., were the highest in 10 years. At Mt. Carmel, the crest was the highest since 1913. Flooding along the lower White River in Indiana was the highest in 5 years at some points. The crest on the Little Wabash River at Carmi, Ill., was the second highest in the history of the station.

March

Extensive flooding occurred in the Upper Big Blue River Basin in Nebraska during March. Turkey Creek near Wilbur, Nebr., exceeded the 10-year record established in March 1960. The West Fork Big Blue River exceeded the 11-year record of March 1960 but was several feet below the historical high water mark of July 1950. Flooding along the mainstem of the Big Blue River generally approached the last heavy March overflows in 1960.

A near record flood occurred on the Iowa River at Marshalltown, Iowa, during the latter part of March. Snowmelt runoff caused extensive flooding in Iowa along the South Raccoon and North Rivers, the entire Skunk River Systen, the West Fork of the Cedar, and Black Hawk Creek.

April

The most significant flooding during April was the snowmelt floods in the Red River of the North, the Upper Mississippi and Missouri Basins. The total flood damages were estimated at $151 million. The number of deaths by drowning were reported as 9.

In the Red River of the North Basin, the spring flood of 1969 was the greatest since 1897 from the headwaters to Grand Forks, N. Dak. Below Grand Forks, the flood crests were slightly lower than in April 1966. Record stages were reached on the Red Lake River at Crookston, Minn., and on the Sheyenne River at West Fargo, N. Dak.

In the Upper Mississippi Basin, record flooding occurred on some tributary streams in southern Minnesota and northwestern Iowa. Along the mainstem of the Mississippi, the flooding from the headwaters to Davenport, Iowa, was generally of the second and third magnitudes. In the reach from St. Paul, Minn., to Winona, Minn., and at scattered points to Davenport, Iowa, the flood of 1969 was exceeded only by the flood of 1965.

In the Missouri Basin, record flooding occurred on some tribuatry streams in eastern Montana, Nebraska, the Dakotas, and Iowa. Flooding along the mainstem of the Missouri River was comparatively light.

May

The most significant flooding during May was the receding snowmelt floods in the Red River of the North Basin, the Upper Mississippi Basin and the Missouri Basin. All streams were back within their banks at the

end of May, except the Souris River near Bantry and Westhope, N. Dak., and the James River at Columbia and Stratford, S. Dak. The Souris River near Bantry, N. Dak., reached a record crest early in May.

Major flooding occurred in the Trinity and Upper Brazos Basins during May. Flash flooding was extensive in and south of Cleburne, Tex., and in the communities of Kennedale and Everman, Tex. Preliminary estimates of flood damage were placed at $4.6 million. Four lives were lost. Dallas and Johnson Counties were declared disaster areas.

June

Near record overflows occurred on tributary streams in the Lower Smoky Hill River Basin in Kansas during June. Record stages occurred in the headwaters of the Marais des Cygnes River. Severe flooding occurred on tributary streams of the Missouri in northwestern Missouri where nearly 200,000 acres of farmland were flooded with damages estimated at over $13 million.

Severe flash floods occurred on the Barren River in Kentucky and on Salt Lick Creek in northern Tennessee. Discharge ratings on the upper Barren River were reported as the greatest of record by the USGS and greater than those likely to occur once in 50 years. Flood damage in Macon and surrounding counties in Kentucky was the result of rampaging small feeder streams, most of which flow northward into the Barren River. The property damage in the Salt Lake Creek Basin at Red Boiling Springs, Tenn., was estimated in excess of $2 million.

July

One of the most damaging floods during July occurred in northern Ohio. Up to 14 inches of rain occurred in certain localities in an area about 20 miles on either side of a line running between Toledo, Ohio, and Wheeling, W. Va. The hardest hit communities were Wooster, Ashland, Millersburg, Loudonville, and Killbuck, Ohio, in the Ohio Basin and Norwalk and Vermillion in the Great Lakes Drainage. Of the 37 fatalities reported in this storm, 30 were due to floods. The total flood damages were estimated between $70 million and $140 million.

Major flooding occurred on the Maquoketa and Wapsipinicon Rivers in Iowa and on the Pecatonica River in Wisconsin and Illinois. Record flooding occurred on the Wapsipinicon and Iowa Rivers, and on Black Hawk Creek in Iowa. Record high stages also occurred on the Pecatonica River in Wisconsin and Illinois.

August

The most disastrous flooding in the nation during August, in lives lost and property damage occurred in the James River Basin in Virginia. The disastrous flooding resulted from torrential rains associated with tropical depression "Camille." The torrential rains caused extensive and severe flash flooding in Rockbridge, Amherst, Nelson, Albemarle, and Fluvanna Counties. The hardest hit by the flash flooding were the Tye and Rockfish River Basins, most of which lie within Nelson County. Devastating and extreme flash flooding occurred in the Maury and Hardware Basins and in portions of the Rivanna Basin. Record stages were reached on the Maury and Rivanna Rivers and on the James River in the reach from Holcombs Rocks, Va., to Richmond, Va. (except at Lynchburg and Scottsville). The total damages in Virginia were estimated at $140 million. The total number of deaths by drowning and mudslides was placed at 110 with an additional 41 persons missing and presumed dead. The west-central portion of the State was declared a disaster area by the President. One million dollars in federal aid was made available immediately for repair and replacement of roads, bridges, and other public facilities.

Record flooding occurred in the headwaters of the Little Blue River in Nebraska. The crest near Deweese, Nebr., exceeded the previous record crest by 1.1 ft. Downstream at Hebron, Nebr., residents reported the highest water levels in 40 years.

September

The most damaging floods during September were minor in comparison to the Virginia floods during August. Severe flooding occurred in northwest Florida with damage in Gadsden County estimated at $2.8 million. The Ochlockonee River at Bloxham, Fla., exceeded the 1964 flood by about 5 feet. The Little River near Quincy, Fla., exceeded the 1964 flood by about 4 feet. Severe flooding occurred in Leon and Liberty Counties where storm rainfall ranged from 10 to 23.5 inches.

October

Major flooding occurred in the Lower Marais des Cygnes Basin below Ottawa, Kans., during October. Crests ranged from 4 to 8 ft. above flood stage from Osawatomie, Kans., downstream and also on Pottawatomie Creek. Agricultural losses in the Lower Marais des Cygnes Valley were estimated in excess of $1.25 million.

Considerable flooding occurred in streams in the northern half of Missouri. One of the hardest hit areas was the Cuivre River Basin in east-central Missouri. A survey of the area from Old Monroe, Mo., to Troy, Mo., revealed that the flooding was probably the highest of record, exceeding the previous record flood of 1941. Record flooding also occurred on the Lower Salt River. Extensive damage resulted to crops and to many homes behind the levees.

November

Damages from the minor flooding in continental United States during November were light.

Extensive flooding occurred along many rivers in southeastern Puerto Rico on Nov. 9. At least 20 towns or cities were damaged. The heaviest damage occurred in the Fajardo area where over 500 families were affected. Preliminary damage estimates were placed at $2 million. There were three deaths by drowning.

December

The most significant flooding in the Nation during December occurred in Maine and in Kentucky.

In Maine, the flooding on the Kennebec River was the third highest of record. Extensive flooding occurred on the Androscoggin and Sandy Rivers and small streams and brooks in Maine. Many people were evacuated from low-lying areas along the Kennebec River. The overall flood damage in Maine was estimated at several millions of dollars.

In Kentucky, major flooding developed along the Upper Cumberland River in the southeastern portion of the State. Crests were very near those of the major flood of March 1963. Homes and commercial buildings outside of the flood protective works received considerable water and flood damage.

SOLAR RADIATION TOTALS

Average daily values (direct and diffuse) received on a horizontal surface, tabulated in langleys.
